George S. Kozak

13 September 2007

The Internet-First University Press
Ithaca, NY

Abstract: This report contains the metadata (or card catalog) for the current contents of the DSpace digital repository managed by the Cornell University Library. This project was initiated by J. Robert Cooke and Kenneth M. King with the funding provided by The Atlantic Philanthropies. Supplementary funding was provided for the immediate-past academic year by the Office of the Vice Provost for Research at Cornell University. Many major projects came to completion this year and the metadata has swelled four-fold. This project's goal is to promote movement to open access availability of all of the scholarly output of higher education. We fully embrace Cornell's motto of inclusiveness, "I would found an institution where any person can find instruction in any study", by making these resources on the broadest possible range of topics openly available to the widest possible audience.

Cornell's DSpace Metadata, July 2007

This is the second edition of the metadata compilation that describes the cumulative contents of this evolving open access digital repository at Cornell University. The first edition was released a year ago and is also available in this repository at http://ecommons.library.cornell.edu/handle/1813/3460, but those contents are included herein.

The size and breadth of the collection has expanded considerably. Many videos and books (new and republished) have been added, as well as individual articles and even websites. A particular effort has been made to capture and make available in digital form some of the important documents of institutional history, e.g., the complete set of more than 100 years of *The Cornell Alumni News*, the complete collection of the *Cornell Chronicle*, and the complete set of *The Engineering Quarterly*.

Department histories so far include: Agricultural Economics (Stanton), Animal Science (Turk; Elliot), Biological and Environmental Engineering (Furry), Chemical Engineering (Smith), Chemistry and Chemical Biology, Food Science (Bandler and Holland) and Physics (Hartman).

Multimedia documents are an especially important focus. Included are DVDs about some prominient Cornell faculty – including Simon Bauer, W. Donald Cooke, Dale R. Corson, Robert H. Foote, Hans Bethe, Roald Hoffmann, Frederick G. Marcham, Fred McLafferty and Harold Scheraga.

Other important collections include: *Bulletin of The New York Agricultural Experiment Station (NYSAES) at Geneva*, (to be placed online in September 2007) *The Bulletin of the Cornell University Experiment Station (CUAES)* and an archival subset of the Global Performing Arts Consortium (GloPAC).

Earlier we have published conferences, e.g. a symposium on the future of the research university (in honor of Dale Corson) and the changing nature of the library collections (Janus Conference).

The collection of videos by Phillip and Maddy Handler having a focus on Cornell AAP Alums now includes: *Portrait of a Cornell Artist: Elsie Dinsmore Popkin, BFA'58; Being Eisenman: Peter Eisenman '54; True Big Red: Professor Don Greenberg '55; Journey from Sibley: Jill Lerner '75; and this year added Big Red/Meier White: A Cornell story of architect Richard Meier '56*.

DSpace also hosts scholarly work by our students – scholarly journals and honors theses of undergraduates, as well as a growing collection of graduate theses and dissertations. Surprisingly, some undergraduate course projects archived here are among the most frequently accessed (BEE 453).

Earlier we augmented the DSpace software with quick submission templates and a counter of the number of times each item has been viewed. The most popular items have been accessed more than 10,000 times (up to 17,000), revealing the power of indexing engines (i.e., Google Scholar) and the interest in open access publishing. A listing of the most frequently accessed follows.

The most frequently accessed items

Materials archived or published here are being found and accessed! Remarkably, 28% of the items have been accessed more than 1,000 times. Five items have been accessed more than 10,000 times.

Note that not all items have been available for the same time span and that frequency is only one metric of interest. Nevertheless, it is clear that the number of submissions and the usage is growing, with a promise that this digital repository is increasing in value.

title: Archives or Assets?
abstract: Hirtle presented an abbreviated version of this address as his presidential address at the opening plenary session of the 67th annual meeting of the Society of American Archivists in Los Angeles on Aug. 21, 2003.This paper discusses the nature of ownership of archival holdings, with special emphasis placed on issues of intellectual property, and the implications such ownership may have on the exploitation of those works. In order to respect the public's interest in archival materials, licensing schemes must be skillfully crafted. If archives are careful not to compromise their own fundamental values when seeking to generate revenue, and if they respect the public?s interest in public domain material, they will be able to avoid much of the criticism that many museums have received over their jealous attempts to monopolize and control their collections.

title: Reason and Transition: On the Concept of Transversal Reason
abstract: This paper redefines the notion of reason as a core intellectual capacity, contrasts it with the concept of multiple rationalities, and shows how it is essential for taking a detached view of ones own position. Reason aims to be as neutral as possible, and provides the capacity to move or see across multiple positions ("transversal reason"). Reason does not necessarily lead to final conclusions, but permits the individual to accommodate irreconcilable perspectives.

title: Rationality and Reason Today
abstract: We live in a conceptual world of divergent paradigms that are entangled with each other. Rationality is therefore characterized by an extreme disorderliness. Only the faculty of reason is capable of looking across this diverse and disorderly condition. Reason does not privilege itself with respect to rationality, but relates to rationality on the basis of logical principles only.

title: Reason: traditional and contemporary, or Why should we still speak of reason at all?
abstract: Reason was once considered a higher order faculty than rationality. Beginning with Kant, rationality began to eclipse reason in significance. Today, we assume the existence of multiple rationalities, each with its own guiding principles. It is now time to resuscitate and redefine reason as a faculty that allows the individual to understand and live with the plurality of rationalities that characterize postmodern thought.

title: High Precision Lattice QCD: Perturbations in a Non-Perturbative World
abstract: The High-Precision QCD collaboration has embarked on a ground-breaking survey of strongly interacting Standard Model phenomenology from lattice QCD using the improved staggered action for light quarks, NRQCD for the heavy quarks and one-loop Symanzik improved gluons. This program requires one- and two-loop perturbative renormalisations of action parameters, matrix elements and currents. The current techniques for lattice perturbation theory are very cumbersome and inflexible, built for individual one-loop applications. Very few two-loop results are known, even for the simplest actions. A new method for performing perturbative calculations in Lattice QCD is presented. The combination of easily determining Feynman rules for arbitrary actions and automated diagram generation has enabled the calculation of six related three-loop quantities for several different actions including the most highly improved, ``Asqtad'' that is being used for the most realistic lattice simulations ever. The necessity of choosing an appropriate scheme and scale for lattice expansions is demonstrated. Further improvements to the scaling in the quark sector

are investigated and a new action with three times smaller errors is obtained. The connection between the lattice and continuum couplings is determined to two-loops for these actions which is a pre-requisite for any future perturbative calculations. Third-order Wilson loops up to 2x2 are calculated for the first time which can be used to determine the strong coupling constant at energies relevant to simulations and to experimenters. The quark mass is renormalised to one-loop in order to determine the mass of the strange quark and compare to sum rules.

title: Unpublished Materials, New Technologies, and Copyright: Facilitating Scholarly Use
abstract: Presented at the Interdisciplinary Conference On The Impact Of Technological Change On The Creation, Dissemination, And Protections Of Intellectual Property, The Ohio State University College of Law, Columbus, OH. March 8-10, 2001.The paper is divided into three parts. The first part explores why, at least with regard to the use of unpublished materials, current interpretations of copyright law have become an impediment to creative endeavors rather than an encouragement to them. Two factors are at work. The first factor is that copyright law imposes on unpublished materials a set of rules and viewpoints meant to govern published material. The second factor that has made the use of unpublished material more problematic is the rise of the Internet and the ease with which people can uncover potential infringing acts. Technology has not changed the law, but it has affected how people interpret the law ? with potentially disastrous results as far as unpublished material is concerned. The second part of the paper considers one possible solution advanced by the Copyright Office to address the problem of what they call ?orphan works? ? works whose copyright owner cannot be located. The last part of the paper considers what might constitute reasonable investigation of the copyright ownership of unpublished works. It may be that the standard for reasonable investigation would be enough to establish a fair use defense of the material, obviating the need for compulsory payments.

title: ONION MAGGOT DELIA ANTIQUA (DIPTERA: ANTHOMYIIDAE) ADULT ACTIVITY AND OVIPOSITION IN NEW YORK ONION FIELDS: IMPLICATIONS FOR MANAGEMENT
abstract: Brian Nault, Jan Nyrop, Alan TaylorInsect pest activity is often concentrated in certain areas within crops. Past research has suggested that onion maggot, Delia antiqua (Meigen) (Diptera: Anthomyiidae), adult activity and oviposition may be concentrated along onion field edges and may be affected by the surrounding landscape. To examine this further yellow sticky cards were placed at varying distances along transects extending from edges of commercial onion fields that either bordered or did not border woods. Sticky cards were collected and replaced weekly throughout the 2002 and 2003 growing season. To determine if oviposition by first-generation onion maggot is concentrated along wooded field edges, potted onion plants were placed along edges and in centers of onion fields that either bordered or did not border woods. Results indicate that adult activity of both sexes is concentrated along edges of onion fields during the first- and second-generations of onion maggot, especially next to woods in the first generation. These “edge effects” lessened as the season progressed and were not present during the third-generation. Oviposition was uniform with respect to distance from the edge and type of bordering habitat. It may be possible to limit application of insecticides targeting adult onion maggot to wooded field edges during the first-generation or to deploy cultural controls here.

A delay in planting the onion crop has been recommended, but never evaluated, as a method of reducing

onion maggot damage. A delay in planting will also result in plants being younger at the time onion maggot becomes damaging, and plants may be more susceptible to onion maggot when they are young. In contrast, planting early might result in onions being older and inherently more tolerant of onion maggot damage. To determine how planting date affects levels of onion maggot damage, damage was evaluated in three sequentially-planted onion plots in a commercial onion field in 2003. Earliest plantings coincided with the earliest commercial sowing date and delayed plantings were made three and six weeks later. To determine how plant age affects resistance to onion maggot, damage to onions of different ages was evaluated in the laboratory after they were infested with varying densities of onion maggot eggs. Ovipositional preference by onion maggot for differently aged onions was also investigated in the lab to determine if a preference for early plantings could result in egg densities being greater on these plants in the field. Onion maggot damage was high in earliest plantings (37%), lower but economically unacceptable in intermediate plantings (21%), and lowest in late plantings (2%). While the latest planting provided acceptable control, planting this late is not currently feasible for New York growers because they prefer to plant as early as possible to maximize size of onion bulbs at harvest. Onion maggot laid more eggs on older than younger plants in choice tests; therefore more eggs may be laid on early vs. delayed plantings in the field. Older plants were more resistant to maggot attack than younger plants at low egg densities, but not at high ones. This may explain why early plantings are more heavily damaged than delayed ones in the field; greater numbers of eggs may be laid on early plantings if they are preferred for oviposition, resulting in damage being higher in early than delayed plantings.Department of Entomology New York State Agricultural Experiment Station

title: EFFECT OF DENSE PHASE CARBON DIOXIDE ON ENZYME ACTIVITY AND CASEIN PROTEINS IN RAW MILK
abstract: Non-thermal methods of reducing bacterial numbers have been studied for more than a century. A majority of this work has focused on high pressure processing (>100 MPa). The addition of carbon dioxide (CO2) at lower pressures (<100 MPa) is a relatively new process, but has demonstrated similar bactericidal effects. Pressurized CO2 has also been shown to inactivate enzymes, but this ability has not been studied in milk. Dense phase CO2 is defined as CO2 which exists in the liquid or supercritical state. A proprietary piece of equipment designed by Praxair (Chicago, IL) applied dense phase carbon dioxide to milk in a continuous manner. Enzyme activity was assayed by acid degree value and protein breakdown. Temperatures between 15?C and 40?C and pressures between 7 MPa and 62 MPa were investigated. Because of milk?s susceptibility to pH change, the process?s effect on casein proteins was also studied. At higher temperatures (40?) and CO2 concentrations, the process was shown to significantly reduce the proteolytic and lipolytic endproducts. However, these conditions also changed the structure of the underlying casein protein. By reducing the severity of treatment both in terms of temperature and CO2 content, no change to the casein was observed. However, in these less severe conditions no significant effect on the rate of lipolysis or proteolysis was observed.

title: Refrains in Ancient Greek Poetry
abstract: What do refrains contribute to ancient Greek poetry? Modern scholarship has usually limited its treatment of ancient Greek refrains to considerations of their external associations. The tendency has been to explain refrains, both individually and as a formal type, by reference to assumed origins for the refrain form and its use in primitive song, for which we have little or no evidence. By contrast, I have attempted to explain the refrain form as an established feature within the ancient Greek poetic tradition. I am interested in two questions. First, what do individual refrains contribute to the individual poems in which they appear? Second, what literary refrain tradition is indicated by the surviving examples? Obviously the answering of one question involves the answering of the other.
Before an examination can be made of individual refrains in context, there are some general questions that must be asked. In CHAPTER 2, I examine the treatment of refrains by ancient Greek scholarship. This involves examining the scholarly terminology associated with refrains, especially the term "ephymnion". In CHAPTER 3 I test the commonly held hypothesis that refrains are sung by a chorus in response to stanzas provided by a soloist. In CHAPTER 4 I address the question of the often assumed relationship between sub-literary song and the refrains in surviving Greek poetry. I do this by investigating ritual cries and their use both within and outside the context of formal refrains.
Once these general questions have been addressed, we may consider individual refrains in context. Since, as I shall argue, refrains find their most natural "home" in the monostrophic and triadic structures of non-dramatic lyric, I begin there in CHAPTER 5. Then I examine refrains in the antistrophic context of dramatic lyric in CHAPTER 6. I conclude my examination with the refrains of bucolic hexameters in CHAPTER 7. As it happens, this order coincides (very broadly speaking) with chronological order and thus reflects what I shall argue is the development of a continuous refrain tradition in ancient Greek poetry.

title: MASCULINITY, WAR, AND REFUSAL: VICISSITUDES OF GERMAN MANHOOD BEFORE AND AFTER THE COLD WAR
abstract: A Dissertation Presented to the Faculty of the Graduate School of Cornell University in Partial Fulfillment of the Requirements for the Degree of Doctor of Philosophy. May 2004. Department of Anthropology. MASCULINITY, WAR, AND REFUSAL: VICISSITUDES OF GERMAN MANHOOD BEFORE AND AFTER THE COLD WAR
Steven Lester Gardiner, Ph.D.
Cornell University 2004
Over the course of the last two centuries, Germany has experienced several shifts in its position in what I refer to as the war system. The war system is an important determiner of masculinity such that variations in one impact the other. The total surrender of Germany in 1945, combined with the association of the Nazi regime with heroic, soldierly masculinity, has opened the door in post-World War II Germany for new forms of masculinity to arise. A key value in the new configuration is the increased importance of refusal and the decreased importance of obedience and subordination. Between 1945 and 1990, Germany remained a nation both divided and occupied. This, combined with the literal feminization of German society in the immediate post-war period, led to the valorization of refusal. In effect, in an occupied society, the relationship of masculinity to nation-state is shifted. At the same time, of course, market pressures have led to a more individuated society? yet it is important to point out that though refusal has become much more common in all Western societies, in none of the traditional Great Powers has the culture of the military itself become so accommodating to the idea of refusal. This shift, I think, can be attributed to the institutionalization of refusal within the Bundeswehr, and its valorization in German society as a whole, as subsequent generations

encounter the failed refusal of the Nazi period in a war system context that has isolated the German military from deadly combat? a situation which is, of course, changing in the here and now. These trends can only really be understood through an analysis that triangulates on changing masculinity by making use of a variety of evidence, historical, literary, institutional and personal. Finally, the relationship between war and masculinity itself should be seen in a longer evolutionary perspective and assumptions about inevitability challenged through comparative ethnography and review of the archeological evidence.

title: The Politics of Identity and Interest in European Defense Industrial Collaboration
abstract: Dr. Judith Reppy, Committee Chair
Dr. Jonathan Kirshner, Committee Member
Dr. Thomas Christensen, Committee Member
Dr. Matthew Evangelista, Proxy/Reader This dissertation is a social constructivist analysis of the ideational foundations of West European defense industrial cooperation. Traditional analytical approaches within International Relations theory, namely structural realism, do not highlight the role that social identity may play in shaping state behavior? except to regard it conceptually as predetermined, as methodologically unapproachable, or as epiphenomenal. The study of European armaments collaboration, however, demands that scholars consider identity as both official elite rhetoric and mass surveys maintain that an emergent, transnational European identity not only exists within the member societies of the European Union (EU), but it may also shape certain areas of state activity. This thesis uses social constructivism as an explanatory framework in order to ascertain the degree that this regional identity facilitates the Europeanization of defense production within the EU.

This dissertation explores five episodes of multinational European defense industrial collaboration conducted between 1967 and 1997: Tornado, Eurofighter, Field Howitzer 70, Self-Propelled Howitzer 70, and the Anglo-French Reciprocal Purchasing Agreement. Further, these cases are divided into high-technology and low-technology categories, with Tornado and Eurofighter forming a high-tech dyad, while the others denote examples of low-tech industrial and market-oriented cooperation. I hypothesize that the production of high-tech military equipment is bound to conceptions of self and of self-interest that promote nationalist behavior and thus restricts the potential for multinational procurement collaboration. Low-tech weapons, on the other hand, do not challenge national identity and thus may reveal the influence of an emerging, cross-cutting transnational identity. This identity subsequently can be manifest in the potential willingness of states to rationalize intra-regional production and to integrate national defense equipment markets. I find, however, that while a distinct European identity exists, its effects do not extend far into the procurement field regardless of the level of technology involved within a given collaboration. Weapons procurement in the European Union remains intrinsically national in orientation.

title: OCCURRENCE OF FRUSTRATION IN HUMAN-COMPUTER INTERACTION: THE AFFECT OF INTERRUPTING COGNITIVE FLOW
abstract: Despite a growing awareness of the importance of emotion, HCI has emphasized the severity of usability incidents as the best method towards creating an enjoyable experience. This study collected the remembered frustrating incidents with technology of 66 participants (132 incidents). Incidents were then coded into one of the five high-level categories of the User Action Framework, a schema for classifying incidents in relation to their occurrence in the interaction cycle.
It was found that the majority of remembered frustrating incidents occur in the Outcome phase, which addresses issues with the system’s internal response to the user’s actions. This is in contrast to where most usability issues occur, in the Translation phase, which addresses issues with the user translating intentions into plans for physical actions. In addition it was found that remembered Outcome incidents are more often low priority usability incidents whereas remembered incidents in Translation are usually high priority usability problems. Finally, those incidents remembered in the Outcome phase are primarily incidents that interrupt cognitive flow.

title: Design of a Four Rotor Hovering Vehicle
abstract: Raffaello D’Andrea, committee chair;
Mark Campbell;
Ephrahim Garcia Potential applications of autonomous vehicles range from unmanned surveillance to search and rescue applications dangerous to human beings. Vehicles specifically designed for hover flight have their own possible applications, including the formation of high gain airborne phased antenna arrays. With this

specific application in mind, the Cornell Autonomous Flying Vehicle (AFV) team sought to produce a four rotor hovering vehicle capable of eventual untethered acrobatic autonomous flights.
The mechanical design of the AFV included both the selection of a battery-motor-gearing-prop combination for efficient thrust production and the design of a lightweight yet sufficiently stiff vehicle structure. The components chosen were selected from the variety of brushless motors, battery technologies and cell configurations, and fixed pitch propellers suited to use in a four rotor hovering vehicle. The vehicle structure settled upon achieved a high degree of stiffness with minimal weight through the use of thin walled aluminum compression members supported by stranded steel cable.
In addition to an efficient mechanical design, the vehicle also required onboard control and inertial navigation. In order to evaluate a variety of potential vehicle sensor, actuator, estimation, and control scenarios, a fully configurable nonlinear simulation of vehicle and sensor dynamics was also constructed. For the current iteration of the vehicle, a square root implementation of a Sigma Point Filter was used for estimation while a simple Linear Quadratic Regulator based on the nonlinear vehicle dynamics linearized about hover provided vehicle control. Sensory feedback on the current vehicle included an onboard inertial measurement unit and a human observer, to be eventually replaced by GPS or an indoor equivalent.
While a hardware failure prevented the completion of a full range of tests, the team was able to complete a hands-free hover test that demonstrated the capabilities of the vehicle. Supplemented with various other final hardware tests, the vehicle demonstrated stable hover flight, potential vehicle endurance in the range of 10-15 minutes, and possible vertical acceleration of 0.8g beyond hover thrust. The final vehicle represented a significant achievement in terms of overall design and vehicle capability while future improvements will demonstrate more advanced nonlinear control algorithms and acrobatic flight maneuvers. title: EFFECT OF TESTOSTERONE ON IGF-I, AR AND MYOSTATIN GENE EXRESSION IN SPLENIUS AND SEMITENDINOSUS MUSCLES IN SHEEP
abstract: Testosterone is known to act differentially on skeletal muscle from different regions. Two genes likely to mediate the testosterone effect are insulin-like growth factor-I (IGF-I), an important growth regulator acting in an autocrine and paracrine way, and androgen receptor (AR), as receptor density could account for differential muscle growth. Another muscle-specific gene that may play a role in differential muscle growth is myostatin, a member of the transforming growth factor-beta superfamily, shown to be a negative regulator of skeletal muscle mass. The objective of this study was to quantify and compare the expression of these three genes in two different skeletal muscles in sheep. East Friesian x Dorset sired ram lambs born from Dorset ewes were used in a 2 x 4 factorial experiment. Eighteen sets of twins were assigned to four age groups corresponding

to 77, 105, 133 and 161 days of age and one individual from each set was castrated at birth. Total RNA was extracted from samples of semitendinosus (ST) and splenius (SP) muscles collected at the time of slaughter. Insulin-like growth factor I mRNA was measured using competitive reverse-transcription-polymerase chain reaction (RT-PCR). Androgen receptor and MSTN mRNA were measured by ribonuclease protection assay (RPA) with standard curves. Splenius muscle weight was greater than semitendinosus muscle weight in rams compared with wethers at 105, 133 and 161 days ($p = 0.05$, $p = 0.04$ and $p = 0.02$). The difference in IGF-I mRNA levels between the two muscles was higher in rams than in wethers at 133 and 161 days ($p < 0.05$) and the difference in AR mRNA levels was higher in rams than in wethers at 105, 133 and 161 days ($p < 0.05$), with higher expression in the SP. No difference was found in the MSTN mRNA level between the two muscles in rams and wethers at any age. These results show that locally produced IGF-I and the regulation of AR expression are important for sexually dimorphic muscle growth patterns.

title: Dependence in Stochastic Simulation Models
abstract: There is a growing need for the ability to model and generate samples of dependent random variables as primitive inputs to stochastic models. We consider the case where this dependence is modeled in terms of a partially-specified finite-dimensional random vector. A random vector sampler is commonly required to match a given set of distributions for each of its components (the marginal distributions) and values of their pairwise covariances. The NORTA method, which produces samples via a transformation of a joint-normal random vector sample, is considered the state-of-the-art method for matching this specification. We begin by showing that the NORTA method has certain flaws in its design which limit its applicability.
A covariance matrix is said to be feasible for a given set of marginal distributions if a random vector exists with these properties. We develop a computational tool that can establish the feasibility of (almost) any covariance matrix for a fixed set of marginals. This tool is used to rigorously establish that there are feasible combinations of marginals and covariance matrices that the NORTA method cannot match. We further determine that as the dimension of the random vector increases, this problem rapidly becomes acute, in the sense that NORTA becomes increasingly likely to fail to match feasible specifications. As part of this analysis, we propose a random matrix sampling technique that is possibly of wider interest.
We extend our study along two natural paths. First, we investigate whether NORTA can be modified to approximately match a desired covariance matrix that the original NORTA procedure fails to match. Results show that simple, elegant modifications to the NORTA procedure can help it achieve close approximations to the desired covariance matrix, and these modifications perform well with increasing dimension.
Second, the feasibility testing procedure suggests a random vector sampling technique that can exactly match (almost) any given feasible set of marginals and covariances, i.e., be free of the limitations of NORTA. We develop a strong characterization of the computational effort needed by this new sampling technique. This technique is computationally competitive with NORTA in low to moderate dimensions, while matching the desired covariances exactly.

title: The Design, Fabrication and Characterization of Independent-Gate FinFETs
abstract: The Independent-Gate FinFET is introduced as a novel device structure that combines several innovative aspects of the FinFET and planar double-gate FETs. The IG-FinFET addresses the concerns of

scaled CMOS at extremely short channel lengths, by offering the superior short channel control of the double-gate architecture. The IG-FinFET allows for the unique behavioral characteristics of an independent-gate, four-terminal FET. This capability has been demonstrated in planar double-gate architectures, but is intrinsically prohibited by nominal FinFET integration schemes. Finally, the IG-FinFET allows for conventional CMOS manufacturing techniques to be used by leveraging many of the FinFET integration concepts. By introducing relatively few deviations from a standard FinFET fabrication process, the IG-FinFET integration offers the capability of combining three-terminal FinFET devices with four-terminal IG-FinFET devices in one powerful technology for SoC or Analog/RF application, to name only a few.
The IG-FinFET device is examined by device modeling, circuit simulation, testsite design, fabrication and electrical characterization. The results of two-dimensional device simulations are presented, and the effects of process variations are discussed in order to understand the desire for a fully self-aligned double-gate architecture. Circuit design is investigated to demonstrate the capabilities of such a double-gate device. Physical designs are also examined, and the layout penalties of implementing such a device are discussed in order to understand the requirement of double-gate and independent-gate integration. A test vehicle is designed and presented for the structural integration and fabrication process development necessary for the demonstration and validation of this novel device architecture. The processing and results of several fabrication experiments are presented, with physical and electrical analysis. The integration changes and process modifications suggested by this analysis are discussed and analyzed. Fabricated devices are then electrically and physically characterized. The final set of fabricated devices show excellent agreement with simulated devices, and experimental verification of double-gate device theory. The results of this work provide for a new and novel device architecture with wide ranging technology application, as well as a new fabrication platform with which to study double-gate device theory and further technology integration.

title: Reassessing Ancient History: Trends in 20th Century Historiography
abstract: MA Committee Members: Professor Robin McNeal, Cornell University; Professor Sherman Cochran, Cornell University.ABSTRACT
Chinese historians at the end of the twentieth century have reexamined the issues that Republican era historian Gu Jiegang addressed at the beginning of the twentieth century confronted: the relationship between politics and scholarship, the role of archaeology in historical studies, and historical methodology. The issues Gu Jiegang raised remain pertinent to historical studies, and by referring to Gu Jiegang's work for understanding of these issues, historians have attested to his work's durability and flexibility, and even, its controversial nature. Today, as during the Republican period, historians have regarded Gu Jiegang as a revolutionary in the field of historical studies, but while some have admired his role, others have criticized it. However, close examination of Gu's work shows that Gu was not the iconoclast he and contemporary scholars have portrayed him as. Rather, like scholars of the dynastic period and many contemporary historians, he relied upon a thorough knowledge and dedication to the Classical texts, texts that he claimed to disavow.

title: Biodegradable Microspheres with Enhanced Capacity for Surface Ligand Conjugation
abstract: This item is a DISSERTATION.
Committee Chair: W. Mark Saltzman

Committee Members: Judith Appleton, Michael ShulerA poly(lactic-co-glycolic acid) (PLGA) microsphere formulation was developed which incorporates carboxylic acid groups into the microsphere surface. These functional groups are suitable for coupling to a variety of ligands, and form linkages that remain stable in aqueous environments for extended periods of time. The ligand binding capacity of these microspheres compares favorably to that of comparably sized carboxylated microspheres, which are commonly used as model particles for targeted microsphere delivery studies. The morphology and drug release kinetics of this PLGA microsphere formulation are not significantly different from those of microspheres made with traditional reagents. A variety of different protein ligands can be conjugated to the surfaces of these microspheres. These microsphere-ligand conjugates were then used in model systems to evaluate the effect of conjugated ligands on microsphere behavior. Microsphere retention in agarose columns was increased by ligands on the microsphere surface specific for receptors on the agarose matrix. In another experiment, conjugating the ligand Ulex europaeus agglutinin 1 to the microsphere surface increased the adhesion of microspheres to Caco-2 monolayers compared to control microspheres. This increase in microsphere adhesion was negated by co-administration of L-fucose, indicating that the increase in adhesion is due to specific interaction of the ligand with carbohydrate receptors on the cell surface. These results demonstrate that the ligands conjugated to the microspheres maintain their receptor binding activity, and are present on the microsphere surface at a density sufficient to target the microspheres to both monolayers and three-dimensional matrices bearing complimentary receptors. These microspheres combine the capability to target specific cell types through surface-conjugated receptors with the ability to release encapsulated drugs over extended periods of time. This combination of properties enhances the utility of biodegradable microspheres for a variety of drug delivery applications.National Institutes of Health, Air Force Office of Scientific Research

title: A STUDY OF THE FORM FACTORS IN SEMILEPTONIC NEUTRAL D-MESON DECAYS TO PION AND KAON MODES USING THE CLEO-III DETECTOR
abstract: Ritchie Patterson (Committee Chair),
Matthias Neubert,
Jim AlexanderWe measure the ratio of branching fractions, R0 = B(D0 -> pi l nu)/B(D0 -> K l nu), where l is an electron or muon. We also measure the normalized rates for D0 -> pi l nu and D0 -> K l nu as a function of the momentum transfer squared (q^2). The data were collected with the CLEO-III detector while the Cornell Electron Storage Ring (CESR) was running at or just under the Y(4S) resonance. We find R0 = 0.082 +- 0.006 +- 0.005, where the first uncertainty is statistical and the second is systematic. We fit the normalized q^2 distributions with two form factor parameterizations, the simple pole and modified pole functions. For the simple pole fits, we find effective masses, M_poleDK = 1.89 +0.05 -0.05 +0.04 -0.03 GeV and M_poleDpi = 1.86 +0.10 -0.06 +0.07 -0.03 GeV, where the first uncertainty is statistical and the second is systematic. For the modified pole fits, we find alpha_DK = 0.36 +0.11 -0.10 +0.03 -0.07 and alpha_Dpi = 0.37 +0.20 -0.31 +0.16 -0.14, where (1/sqrt(alpha))*M_D*(s) is the effective mass of the second pole and again the first uncertainty is statistical and the second is systematic. Using the measured value of R0, and the modified-pole-optimized form factor shapes, we find the product of the ratio of form factor normalizations at q^2 = 0 and the ratio of CKM matrix elements, |f^pi_+(0)/f^K_+(0)|^2|Vcd/Vcs|^2 = 0.038+0.006 -0.007 +0.005 -0.003 (the first uncertainty is statistical and the second is systematic). Experimental measurements of these heavy-to-light form factors are crucial to constraining the theoretical techniques used to calculate them. Improved understanding of semileptonic form factors can aid precision measurements of the CKM matrix elements, in particular exclusive semileptonic measurements of |Vub|.National Science Foundation, the U.S. Department of Energy, the Research Corporation, and the Texas Advanced Research Program

title: Budget Travel in South Asia: Searching for the Real
abstract: Over the past two decades extended budget travel (BT) has become a significant way for large numbers of people from the West to experience the world outside of their national borders. Once considered a fringe activity, BT has seen its cultural and social acceptance rise and it is today attracting more people from more walks of life than ever before. Further attesting to its popularity is the wide assortment of ancillary industries and medias that nurture and support it. This thesis will examine how BT is used as a means to satisfy the desires of people in the West for a ?realness? which is no longer found in their alienated, post-modern, post-industrial home societies, and how BTravelers use the markers of realness found in the BT experience to construct their own identities. I will conclude, however, that BT is itself, due to its very form and the conditions that produce it, a commodified experience that, rather than being a liberation from the alienated life, is itself an alienated form of action that reproduces and extends the same conditions that at its core it aims to transcend.

title: The Role of Cercopagis pengoi in Nearshore Areas of Lake Ontario
abstract: Exotic species introduced to Lake Ontario in the past 100 years have had varied effects on the food web. The exotic cladoceran Cercopagis pengoi is a zooplankton predator, and the effects of its establishment (in 1998) were difficult to predict without research conducted years since its introduction. Little to no work has been conducted at spatial scales necessary to examine the role of C. pengoi on a lakewide basis. This study was conducted to assess the relative importance of C. pengoi as prey and predator by examining its abundance, distribution, and potential impacts based on these variables and its trophic interactions with zooplankton and fish.
Data from a number of field studies were used to develop equations relating acoustic size (target strength) to length and mass, which allowed estimation of abundance using acoustic surveys. Target strength varied significantly with length and mass. Target strength equations were significantly different from previously published equations.
Field collections revealed that C. pengoi was an important prey item for only for juvenile and adult alewives > 66 mm total length. Due to the planktivorous nature of C. pengoi and similar distributions of these organisms, alewives and rainbow smelt also compete with C. pengoi. The relative importance of C. pengoi as prey and competitor depended on fish size and habitat use; habitat use determined the degree of spatial overlap, while fish size and the defensive spine of C. pengoi influenced the degree to which these fish were able to utilize C. pengoi during periods of spatial overlap.
Late summer abundance of bosminids, Diacyclops thomasi, and copepod nauplii was significantly lower in 1998-2000 than 1995-1997, while abundance of Daphnia retrocurva did not vary significantly. Other factors that may have contributed to this decline were excluded by examination of their seasonal patterns. I concluded that predation by C. pengoi caused the observed declines. The relative magnitude of consumption by C. pengoi and alewives indicated that they were important predators and competitors and both were capable of structuring zooplankton community structure through predation.New York Sea Grant

title: Inherent Faith and Negotiated Power: Swaminarayan Women in the United States
abstract: In this thesis, I explore the ways in which women negotiate their own forms of power in the Bochasanwasi Akshar Purushottam Swaminarayan Sanstha (BAPS), a branch of Swaminarayan Hinduism. The study draws from research in primary sources, scholarly sources, and from fieldwork in Atlanta, GA where the Swaminarayan community has grown tremendously in recent decades, and the Shri Swaminarayan Mandir (BAPS) has become the southeast region's leading temple.
In Swaminarayan temples, men and women practice strict gender segregation and conduct their own separate and parallel programs in temple life. The saints and the Guru of the BAPS tradition are male only, however, and practice a strict form of celibacy that does not allow them to touch, speak to, or look at women. Therefore, women do not have the same access to religious specialists as do men. Regardless, women are often characterized as more religious than men, inherently faithful, and better devotees. While I find it difficult to substantiate the argument of equality, so too do I find difficulty in the argument of women's marginality. I argue in my thesis that separate gender roles in Swaminarayan religion, even when not equal, do not necessarily marginalize or subjugate women. The question of equality between religious roles of women and men is more complicated than one gender acting as super ordinate and another acting as subordinate. My research looks at the ways women can and do assert power in the Swaminarayan tradition through their own initiatives and from their own spaces.Pluralism Project at Harvard University

title: Ballistic Electron Transport in Aluminum Oxide
abstract: R.A. Buhrman, D.C. Ralph, P.W. Brouwer Aluminum oxide (alumina) is becoming an increasingly important material in high performance electronics. It is the insulator in magnetic tunnel junctions used for MRAM and may allow for the fabrication of solid state qubits based on Josephson junctions. In this thesis I have used ballistic electron emission microscopy (BEEM) to study the physical and electronic structure of alumina.
BEEM's high spatial resolution (~1 nm) was exploited to study the alumina surface where clusters of chemisorbed oxygen were observed. The overall behavior of these clusters helped piece together the electronic structure of the material, in addition to the oxidation process itself.
While the data from the oxide surface studies can be interpreted under the standard set of assumptions people generally impose on BEEM (i.e. no scattering) the data obtained when the oxide is buried cannot. In the latter case the signal levels are too low to ignore scattering.
Before the spectra of buried oxide films could be interpreted, scattering needed to be understood. Scattering in BEEM is nothing new. Kaiser and Bell (BEEM's inventors) did the experiment nearly a decade ago when they injected holes into a Au base and collected electrons with n-type Si. The essential physics behind the scattering process was properly described in their work. However, fits to data using their theory failed at electron energies above 1.3 eV. By properly accounting for the density of tunneling states, the Kaiser-Bell approach can be modified to correctly describe the data at higher electron energies.
Once simple systems could be reliably fit, scattering BEEM could be used to study alumina. In the case of hole injection, a higher turn on voltage (relative to Au on Si) is observed which is described by an inelastic scattering process. In the case of electron injection, the same scattering is present and is observed because the alumina attenuates the otherwise dominant unscattered signal.

Scattering also effects spin transport. As scattering increases, the polarization of a ballistic electron beam becomes diluted. This is observed as the fading of contrast in magnetic images as alumina forms between two ferromagnetic layers.DARPA, NSF, ONR

title: SPATIAL, TEMPORAL, AND HYDROLOGICAL VARIATIONS IN PHOSPHORUS RETENTION IN A LARGE CATTAIL WETLAND
abstract: Special Committee Chair: Professor Rebecca L. Schneider, Department of Natural Resources
Committee Members: Dr. M. Todd Walters, Department of Biological and Environmental Engineering, William F. Coon, U.S. Geological SurveyABSTRACT:
Wetlands are now heavily regulated and recognized as key landscape features because of their roles in improving water quality through the removal of dissolved and sediment bound contaminants. However, wetland filtration processes are still the subject of considerable research, and limited evidence suggests that wetland filtration varies considerably as water levels follow natural rise and fall cycles. From April 2002 until April 2003, research was conducted in the Ellison Park Wetland, an 87-hectare cattail-dominated marsh near Rochester, NY, to determine how spatial and temporal variations in phosphorus (P) retention mechanisms, as well as a varying hydrological regime, affect P dynamics. A mass balance approach was used to determine how P retention processes vary seasonally or spatially. Groundwater and surface water hydrology of the study site were carefully monitored, using stage gages and seven nests of piezometers distributed throughout the study site, to determine potential influences it has on the wetland?s biogeochemistry. Replicated samples of the wetland substrate, plant tissues, litter, surface water and groundwater were collected at 18 stations seven times between May 2002 and April 2003 and analyzed for P content. Our findings show distinct differences in P dynamics spatially, in near-stream vs. interior plots, with different sets of processes driving retention in these wetland environments. The near-stream environment accounts for 70% of P retention whereas interior sites account for 79 % of surface area. Near-stream P retention is driven by long-term and short-term deposition of silt and clay-rich sediment associated with over-bank flood events, creating a greater capacity for P retention on a per volume basis. In contrast, the marsh interior has a more organic substrate with a lower total P content and lower aboveground plant growth. The combined effects of cattail phenology and two distinct hydrologic phases during the study period (wet spring and dry summer) on P processes show that a wetland?s ability to filter P is more dynamic over space and time than often assumed. As precipitation patterns become variable due to climate change, improved knowledge about P retention mechanisms in natural wetlands will be useful for water quality improvement.Society of Wetland Scientists, the IGERT in Biogeochemistry and Environmental Biocomplexity, the RTG in Biogeochemistry and Environmental Change, the Cornell University Andrew Mellon Grant Program, Cornell University Department of Natural Resources, and the U.S. Geological Survey

title: Non-Migratory Bioactive Packaging: Covalent attachment of bioactive peptides to poly(ethylene) food packaging films
abstract: Joseph Hotchkiss
A. Brad Anton
Christopher OberNon-migratory bioactive packaging is a novel form of active packaging. It is packaging

which elicits a desirable biological response from food systems without the active component migrating from the packaging into the food. Possible applications for this include in-package enzymatic processing and non-migratory antimicrobial packaging. Poly(ethylene glycol) (PEG) oligomers were covalently attached by one end to surface-oxidized poly(ethylene) (PE) films using carbodiimide coupling; bioactive peptides were covalently linked to the free terminus of the PEG chains using the same reaction. Reactions were confirmed and monitored through contact angle measurements, dye adsorption assays, x-ray photoelectron spectroscopy and atomic force microscopy.
Bioactivity of the modified films depended on the peptide attached: antibacterial activity was found for films treated with antimicrobial peptide E14LKK; no activity was found for lactase attached to PE films. Antibacterial activity was demonstrated against E.coli for films to which side-chain-protected E14LKK was attached and then deprotected.
Further investigation of the lactase coupling indicated difficulties with amino-carboxy-PEG attachment, despite prior successes with diamino-PEG; amino-carboxy-PEG coupling requires further optimization. Lactase attached directly to PE was inactive, regardless of lactose inclusion in the coupling buffer, however PEGylated lactase is active: the inclusion of a PEG spacer should improve immobilized lactase activity.
The effect of the modifications on PE properties important in packaging was assessed through physical, mechanical and optical testing. Properties primarily dependent on the bulk characteristics of the material were generally unaffected by our film modifications. Properties sensitive to film surface characteristics (permeability, optical properties, friction) were affected by the modifications; the changes in these properties will need to be allowed for when designing processes and packages involving the modified films, but should not affect the utility of the film for the standard applications of PE.

title: A (Less Than) Zero Sum Game? State Funding for Public Education: How Public Higher Education Institutions Have Lost
abstract: This dissertation studies the long-term decline in state preferences for education spending in the United States. It constructs an expansive state-level panel data set spanning the fiscal years 1976-77 through 2000-2001 to examine how three budget share measures have changed within states over time and across states at a point in time. The share of state discretionary expenditures allocated to public education has fallen by four percentage points since 1977, while the share of public education expenditures allocated to public higher education has fallen by six points. In addition, the share of public higher education dollars appropriated to institutions (as opposed to directly to students) has fallen by four percentage points. Together the declines translate into real institutional appropriation losses of $2,800 per student in an ?average? state ? significantly more than the $1,700 increase in real average public four-year instate tuition rates since 1977.
Among the main findings are that competing budget items do not appear to ?crowd out? education?s budget share. Court mandated K12 funding equalization has resulted in substantial increases in education spending within states, with over a quarter of the increase coming at the expense of public higher education. Attempts by public institutions to increase tuition or raise private funds are seen to trigger a cycle of future budget share cuts, calling into question what institutions can do as they rapidly spiral toward the private ?high tuition? equilibrium. The sensitivity of higher education budget shares to observable state factors has increased over time and dynamic panel estimates indicate that states exercise more discretion over the determination of the higher education ? K12 split than over other budgetary decisions.
Three additional findings are noteworthy. First, cross-cohort ethnic heterogeneity increases have led to funding shifts away from higher education. Second, the surging popularity of targeted, merit student-aid programs appears to have been in an effort to redistribute income to economically well-off families. Third, as more households in a state become eligible to receive federal Pell grants, states move aid away from institutions and toward students ? sanctioning tuition increases to potentially capture increased student eligibility for federal grant aid.

title: Hearts Ablaze: Radio Frequency Ablation as Treatment for Cardiac Arrythmia
abstract: This project analyzes several of the parameters involved in the use of radiofrequency ablation (RFA) in the treatment of cardiac arrhythmia. Arrhythmia is an irregular beating of the heart that can be caused by improperly timed contractions within the heart, which can, in certain circumstances, be corrected by ablating tissue. One out of every five hundred people is born with an arrhythmia and others acquire the condition through heart disease. For heart attack victims, it is the most common cause of sudden death. RFA is a common way to treat serious arrhythmia cases by cutting the short circuit through the destruction of certain tissues. We used finite element analysis along with prototyping software to determine the duration of treatment, with special attention to the damage caused to surrounding tissue. We found that the optimal parameters for most effective treatment were to administer 30V for 120 seconds ? which happens to be the standard method of operation. This destroys the necessary part of the AV node while maintaining the surrounding tissue at relatively normal temperatures.

title: How Warm is an Igloo?
abstract: Homeostasis maintains the human body temperature within a few degrees of 37oC. However, in severe environments, such as a harsh winter blizzard, the body will not be able to maintain a 37oC temperature without the aid of clothes, shelter, and sources of heat. We find the Igloo, a shelter made of ice and snow, a very interesting means of maintaining body temperature. In this project, we have created a mesh of the Igloo system in GAMBIT and ran simulations in FIDAP to examine temperature variation and air flow inside of the igloo, when the human body is the only source of heat. In the steady state temperature profile obtained, areas of highest temperature were located directly around and above the human, and close to the top of the igloo, the temperature was 289K. The areas of lowest temperature were around 266 K, located at the bottom of the igloo farthest from the human. Natural convection caused the velocity of the air in the igloo to range from 0 to 9mm/s. The FIDAP analysis did not take into account radiative heat transfer, so a separate analysis was done, which revealed that there is considerable heat transfer through radiation in an igloo.

title: Hyperthermic Ablation of Hepatic Tumors by Inductive Heating of Ferromagnetic Alloy Implants
abstract: This study is an investigation into the ability of ferromagnetic thermal therapy to destroy cancerous hepatic tissue. Ferromagnetic rods are implanted in cancerous tissue and heated by induction. Increased temperatures result in tumor destruction. Because alloy implants are minimally invasive, used for multiple treatments and are temperature self-regulating, they represent a superior cancer treatment compared to many alternatives. The focus of modeling ferromagnetic thermal therapy will be to maximize tumor obliteration by considering heating temperature and the placement of alloy rods. Data on the efficacy of different Curie points and probe arrangements as well as sensitivity to variations in material properties are presented. Recommendations are made for the implementation of this treatment based on the modeled results.

title: Lord of the Mood Rings
abstract: Our main objective is to study the mechanisms by which heat transfer taking place in the human finger will affect the color change in the mood ring. This project uses GAMBIT and FIDAP to model the heat transfer from the finger to the ring. Finding the possible range of heat generations, one can estimate the temperature range of the surface and thus the best type of LC to be used in a ring. By determining the temperature in the ring at steady state the blood flow rate can be quantified, which will provide the required heat generation to change the mood ring to any desired color. We obtained several Q?s ranging from 6800 to 7200 W/m^3 appropriate to blood flow rate, and ambient conditions with no forced convection for the model. Further sensitivity analysis was done for selected data input, such as conductivity and source term, to assess their impact on the results. It was concluded that blood flow rate corresponding to the heat generation values used ranged from 0.245 to 0.265 cm^3/min. From the results it is recommended that the color change in the LCD crystal should be most sensitive over the range of 32 to 35 ?C.

title: An Alternate Treatment for End Stage Coronary Artery Disease: Transmyocardial Laser Revascularization (TMR)
abstract: Coronary artery disease involves the buildup of plaque (from cholesterol) on the inside of the arteries, which limits the flow of blood through the vessel. Occlusion of these vessels leads to angina and ultimately to heart attacks. Several common treatments exist to reopen the arteries including angioplasty (with or without a stent), atherectomy, and laser ablation. However, surgical procedures are sometimes necessary and the available options are bypass surgery and transmyocardial laser revascularization, TMR. TMR is a procedure in which ten to forty 1mm channels are created in ischemic heart tissues, where the number of channels made varies from patient to patient based on their individual casesi. This procedure allows for oxygenated blood to flow into the heart and will also result in revascularization the deoxygenated heart tissuesi. This procedure was modeled using Gambit to create the mesh and FIDAP to model the diffusivity of oxygenated blood into deoxygenated heart tissue. The governing equations used to model the flow of oxygenated blood through the channel and diffusion of the oxygen into the deoxygenated tissue layer were the species and momentum equations. No reaction term was used in the species equation because it was assumed there was no elimination of oxygen by the tissue. A fully developed parabolic velocity profile was assumed in conjunction with the momentum equation. The initial conditions included an oxygen concentration of 0.2 ml 02/ml blood at the intake and 0.1 ml 02/ml blood in the deoxygenated muscle. The boundary conditions consisted of a constant zero flux at the top, left wall, right wall, and axis. The exit of the channel is free as is the blood/muscle interface because FIDAP will solve for the 02 concentration based on the other parameters that were specified. Based on this model, it is evident that oxygenated blood in the newly created channels does diffuse into the deoxygenated heart tissue. Although there is diffusion throughout the entire sample, the diffusion nearest the inlet is greatest and decreases along the length of the channel and radially outward from the channel as expected. In addition, the desired oxygen concentration, 80% saturationvii, was achieved at the channel-tissue boundary but not within the tissue layer. These results could be attributed to some of the assumptions that we were forced to make in modeling the procedure due to the limitations of the software in handling a two-phase model. However, with the optimal diameter found, 1.4 mm, and a closer channel spacing, a more optimal diffusion profile may be achieved.

title: Put Your Best Teeth Forward: A Mass Transfer Study of Crest Whitestrips
abstract: Crest Whitestrips are thin, liquid films adhered to a plastic exterior that can be applied directly to the tooth, enabling mass transfer of its active ingredient, hydrogen peroxide, to penetrate the tooth outer layer. The tooth outer layer consists of enamel and dentin. The goal of this study was to model the concentration of hydrogen peroxide as it moves through the gel tooth outer layer for a period of 30 minutes. GAMBIT was used to create a two-dimensional mesh modeling the three layers through which the hydrogen peroxide diffuses through: the gel, enamel and dentin. FIDAP was then used to model the process in which hydrogen peroxide moved through these three layers. A sensitivity analysis was performed varying the diffusion coefficients and reaction rate of hydrogen peroxide being used up. It was found that accurate values for all of these properties must be obtained in order to determine an accurate solution.

title: In Vitro Scaffold Construction for a Bio-artificial Liver
abstract: The main focus of this investigation is to design a scaffold that will accommodate a growing Bio-Artificial Liver (BAL) with oxygen. The two design objectives are to find the maximum length and the distance between the artificial capillaries of the scaffold to provide adequate oxygen supply above 1.98 x 10-19 g/um3 to prevent hypoxia to the growing liver tissues. By utilizing industrial modeling software, FIDAP and GAMBIT, a model of a single capillary with liver tissue attached directly was constructed to simulate the oxygen delivery by means of diffusion and convection from the capillary wall to the tissue and the uptake by metabolism. From the results obtained, it was concluded that diffusion, not convection of the oxygen flow within the capillary was the dominant process of oxygen transport throughout the tissue. The maximum distance traveled into the tissue with capillary length of 60 ?m was 147 ?m from the capillary at the inlet side of the tissue while diffusion at the outlet tissue was at a modest 108 ?m. These values are unacceptable for the feasible construction of oxygen transport system solely based on diffusion. Thus, this investigation concludes that novel methods of greater complexity are needed to construct a more efficient and economically applicable oxygen delivery system for the mass production of bio-organs.

title: The Risks of LASIK Corrective Eye Surgery: A Mass Transfer Approach to a Universal Concern
abstract: The laser vision correction procedure, LASIK, requires a thin flap of the cornea to be created by a microkeratome knife. The focus of this project was to study and quantify the moisture loss from the tiny corneal flap using the concepts of mass transfer. Significant (10 fold) moisture concentration differences between the bottom and top surface of the corneal flap were observed, in conjunction with a strong dependence on the diffusivity of the flap as well as the length of the procedure time. Outer edges of the flap suffered the most water loss. Amount of moisture loss (85% in two minutes) in addition to the location(s) of "dry spots" were hypothesized to influence one of the few recurrent complications of LASIK, flap misalignment.

title: INDIVIDUAL AND GEOGRAPHIC VARIATION IN LIFE HISTORY TRADEOFFS IN TREE SWALLOWS AND EUROPEAN STARLINGS
abstract: This work investigated individual and geographic variation in life history tradeoffs in tree swallows (Tachycineta bicolor) and European starlings (Sturnus vulgaris) by examining how breeding females make tradeoffs between current and future reproduction. In tree swallows, timing of breeding is a strong predictor of reproductive success, with early laying birds tending to have higher fitness than do later laying birds. Experimental manipulation of offspring numbers in Ithaca, NY, revealed that later-laying females raising enlarged broods showed significantly decreased cell-mediated immune responses to phytohaemagglutinin (PHA) and humoral responses to sheep red blood cells (SRBC) relative to higher-quality females. Nestlings in enlarged broods grew at slightly slower rates, but otherwise nestlings did not differ in offspring quality among groups, suggesting tree swallows are willing to trade immune self-maintenance for offspring quality.
The short-term stress of raising enlarged broods had long-term consequences. Females raising enlarged broods in year 1 mounted weaker secondary antibody responses to SRBC than did control females. Most importantly, females in year 2 that showed stronger secondary responses were more likely to return to breed for a third year.
A brood manipulation experiment was conducted at the extremes of the tree swallow range: Alaska and Tennessee. In Alaska, breeding females raising enlarged broods increased feeding effort, decreased immune responses and raised offspring in similar quality to unmanipulated broods. However, in Tennessee, females raising enlarged broods did not increase feeding effort and, consequently, did not show decreased immune function and raised lower quality offspring. Tennessee females returned to breed at higher rates than did Alaska females and maintained higher cell-mediated responses than did Alaska females, suggesting different resource allocation patterns.
To investigate offspring quality in more detail, a study was conducted to examine factors affecting nestling immune response in European starlings breeding in New Zealand. A split-nest cross-fostering brood manipulation revealed that nestling immune response was influenced by female genetic quality (in part through spleen size), maternal effects (in part through temperature conditions), and parental resource allocation (through residual body mass).
Overall, this research adds to our understanding of how individuals differ in the tradeoffs associated with reproduction and how these responses can lead to geographic differences in life histories.

title: A Spatiotemporal Model of Forest Cover Dynamics and Household Land Use Decisions by Subsistence Farmers in Southern Cameroon
abstract: Christopher B. Barrett, Richard N. Boisvert, James P. LassoieShifting cultivation is one of many phenomena involving the interaction of humans with their natural environment, for which the spatial and temporal dimensions are essential to understanding the system. As a spatiotemporal phenomenon, shifting cultivation uses forest resources to provide the means for human sustenance, both from the temporary use of patches of forest for agricultural production and from the harvest of non-timber forest products from that same mosaic of forest and agricultural land.
There are many factors that affect household decisions to clear forested land for cultivation as well as the permanence of land clearing (deforestation or temporary clearing). Even though subsistence households act independently, their individual decisions have a significant collective impact. Key to addressing the sustainable use of forest resources is a correct understanding of household decision-making and spatiotemporal dynamics.

The principal objective of this research is to investigate the spatial and temporal dynamics of forest use by subsistence agricultural households by developing a mathematical model that is able to mimic the spatial patterns (mosaic) of land use typical of subsistence agriculture in southern Cameroon.
More specifically, I develop a conceptual framework for the dynamic choice of spatial location for agricultural production. I investigate household preferences for particular characteristics of forest and fallow land for cultivation and predict them based on household socioeconomic characteristics. The resulting parameter estimates drive a structural simulation model that simultaneously models decisions in space and over time by a heterogeneous set of households representative of the study communities. The model is specified so that it can be adapted to different locations and their specific social and economic contexts. While the ultimate goal is to link the model developed herein to a larger model of livelihood choice at the household level, at its present level of development it provides significant insights into the spatiotemporal dynamics of forest use and shifting agricultural production. It is able to differentiate between the standard Boserup hypothesis of population-induced intensification and model other factors that have a significant impact at the village and household scale. Personal preferences over particular forest or fallow characteristics impact land use intensity. The model demonstrates the importance of path-dependency as a factor in the evolution of the forest-fallow-agriculture mosaic. Finally, I demonstrate its use for comparative dynamic analysis of the impact of exogenous economic shocks and alternate policy scenarios on households and the agriculture-fallow-forest mosaic.

title: THE FAILURE OF CIVIL SOCIETY?: AN ETHNOGRAPHY OF NPOS AND THE STATE IN CONTEMPORARY JAPAN
abstract: This dissertation is an ethnographic study of the emergence of nonprofit organizations (NPOs), which have been proliferating in Japan since the passage of the Law to Promote Specified Nonprofit Activities (so-called NPO Law) in 1998. My research analyzes the dynamic micro-politics of everyday interactions between the state and ordinary people in the creation and ongoing activities of an NPO. It especially focuses on how different levels in the Japanese government shape these civil-society organizations into a structure that supports the state?s goals, and how people at the grassroots level respond to the state?s actions. Furthermore, this dissertation examines the meaning of civil society in an anthropological context. My approach explores the mutually constitutive roles of state and society, avoiding any easy essentialism or stereotyping of Japan?s social and political development, but it does aim at destabilizing some of the key assumptions regarding civil society.
Based on twenty months of ethnographic fieldwork, from September 2001 through April 2003, in Tokyo, I document the transition that Japanese society at a grassroots level has undergone since this epoch-making law allowed thousands of civic groups to be acknowledged as proactive participants in Japanese social and political life. My fieldwork involved intensive participant observation as an unpaid staff-researcher at an NPO promoting continuing education in the local community; this field research was supplemented by extensive interviews with NPO participants, Japanese NPO experts in academia, and government officials, attendance at workshops for NPO practitioners across the country, as well as discourse analysis of mass media coverage about NPOs. What I did not see was evidence of a transition, however. The state continues to be strong, and NPOs ? a product of the state?s deliberate institutionalization of civil society ? are now even synonymous with the state. The state is an unusually strong actor, retarding development of a healthy, dynamic civil society. The state is using underhanded tactics for institutionalizing civil society to meet its goals. The case

calls into question the relationship between state and society in contemporary Japanese life, and raises the issue of whether civil society can be created through the actions of the state.

title: On the Behavior of Price in a Supply Chain Market for Capacity
abstract: We are interested in the concept of dynamic pricing of production capacity in a supply chain and in particular, understanding how the supply chain structure might affect the volatility of capacity prices. We find that supply chains with high capacity costs will experience high price volatility.
We consider a continuous time market for a single homogeneous commodity. The market consists of two kinds of agents: sellers, who own capacity and incur short-term and long-term costs of updating capacity and earn their revenue through the sale of capacity to the second kind of agents, buyers, who hold inventory and satisfy the demand of end-consumers. The end-consumers and their interactions with buyers are an exogenous component of this model. We consider three different models that differ in the modelling of the end-consumer demand. In the first model, end-consumer demand is deterministic. We obtain closed form expressions for market capacity, production and equilibrium price.
We use the solution to the first model to analyze the second model in which end-consumer demand is the sum of a deterministic and a Brownian Motion component. Again, we obtain closed-form expressions for equilibrium price, production and capacity. We use the closed form solution of the equilibrium trajectories to obtain their variance and, subsequently, to analyze the impact of cost parameters on their variance. We find that the variance of the price increases as the short-term and long-term costs of changing capacity increase relative to the holding cost. We obtain similar results using a variation of the above model in which capacity of each seller is exogenously fixed.
In the third model, we incorporate the evolution of forecasts in the end-consumer demand model but fix the capacity of each seller. We find that the early learning of end-consumer demand results in early learning in the market price forecast process. We also find that the market cost parameters affect the rate of learning of the price forecast.

title: Radiofrequency Ablation to kill Kidney Tumors
abstract: Radiofrequency ablation is a technique to destroy tissue cells by heating them above 460C. This method is specifically used in treating tumors smaller than 5 cm in diameter by placing the heated probe within the dysfunctional tissue mass. Depending on the size and shape of the tumor, the ideal time of treatment, voltage, and shape of probe required to eliminate the cells is decided. This study tested a spherical tumor with a 2 cm diameter to determine the best probe shape, voltage, and time of treatment to destroy cancerous cells while keeping surrounding tissue unaffected. Our results indicated that a lower voltage (0.27 volts) and a longer period of time (700 seconds) yielded the best results when using a T-shaped probe. These results account for the diffusion of the heat within the tumor cells while minimizing the damage to the surrounding tissue. Sensitivity analysis indicated that specific heat and tissue density had very small impact on the temperature profile.

title: Modeling Heat Flows in a Hibernating Black Bear
abstract: The American Black Bear (Ursus americanus) has the ability to sustain a high core temperature throughout the duration of its hibernation cycle, even as outside temperatures fall to -20?C. This ability is largely due the conversion of chemical energy into heat in specialized tissue known as brown fat. We demonstrate temperature variation in a hibernating black bear on a macroscopic scale, without attempting to demonstrate local temperature variation. In this first glimpse of the physical processes underlying thermoregulation in a hibernating black bear, we have incorporated heat generation within a layer of brown fat. Our model indicates that brown fat tissue is capable of providing the energy need to maintain a high temperature. However, our model also points to the importance of the thick fur layer, as well as that of the fat layer, in providing basic insulation. At steady state, a temperature drop of over 40?C occurs in these two layers, keeping the body core at a temperature high above that of the surroundings. Without the insulation provided by these essential layers, along with thermogenesis in brown fat, it is unlikely that the bear would survive a 100-day hibernation cycle.

title: Temperature Profile Of the Brain During Suspended Animation
abstract: In most cases of serious truncal injuries, cardiac arrest occurs within minutes due the severe blood loss. Although many of these injuries are potentially repairable, death is often resulted from fatal brain damage due to insufficient supply of blood. Suspended animation (SA) is a way to preserve the whole organism by lowering brain temperature during prolonged cardiac arrest (often over one hour). A hypothermic flush of cold saline solution is administered through blood vessels to the brain. By lowering the rate of cerebral metabolic activity, damage to the brain is reduced and the brain can be preserved for later cerebral resuscitation. Current studies have focused on animals but no experiment has been implemented on humans yet. In our project, we use GAMBIT and FIDAP to model the temperature profile of the brain during suspended animation. A suitable model of saline flow through blood vessels in the brain is developed to determine how temperature in the outer brain region changes at any given time. From our model, the temperature in the outer brain quickly drops to 8?C after flushing a saline solution of 4?C. While saline is very effective in reducing outer brain temperature, the decrease in brain temperature can be adjusted by using saline solutions of different temperatures.

title: Cryopreservation of the Kidney: A Feasibility Study Based on Cooling Rates
abstract: This project models the cryopreservation of a kidney submerged in liquid nitrogen. Attempts to cryopreserve whole organs have been unsuccessful in the past due to the formation of ice crystals in the intracellular fluid, which cause damage to the cells. Damage can be avoided if cells are vitrified, which causes the intracellular fluid to form a glassy solid rather than ice crystals. The vitrification process is hard to achieve because it generally requires very high cooling rates, but it is aided by the addition of cryoprotectants. This study used Gambit TM and FidapTM software to model cooling rates using different concentrations of glycerol as a cryoprotectant. The concentrations of glycerol were varied to maximize vitrification, and thus cell survival. The results of this study show that the addition of cryoprotectant does alter the cooling

rate. Cells closest to the surface of the kidney would likely have been vitrified while cells closer to the center had a slower cooling rate and would most likely have formed ice crystals. Cell survival is predicted to be highest for the 2M concentration of glycerol; however, higher concentrations should be avoided to prevent cell toxicity.

title: Cryopreservation of Umbilical Cord Tissue for Stem Cell Harvesting
abstract: Stem cell transplantation has become an important process used to treat patients with bone marrow diseases. When implanted into patients, stem cells from the umbilical cord have been found to successfully proliferate as new neurons and glia, thereby improving the patients? health. Neurons and glia are imperative for the health and normal function of our nervous system. Neurons are electrically active cells that can produce action potentials to transmit signals based on electrochemical impulses. Glia, which comprise a large part of our nervous systems (90% of the brain alone), were once dismissed as mere padding in the nervous system. However, it is now known that they are actually an integral component of the system, serving to facilitate and ensure the proper transmission of signals between neurons. Damage to or loss of neural cells, whether due to physical injury, removal (as in the case of cancer) or diseases such as Motor Neuron Disease (MND) and Parkinson?s disease is severely detrimental to one?s health. Using current tissue engineering technology, stem cells harvested from the matrix of the umbilical cord (known as Wharton?s Jelly), may be differentiated into neurons or glia, effectively replacing those that were lost or damaged. To ensure biocompatibility, umbilical cord matrix cells from direct relatives are used. Therefore, cryopreservation of these cells is imperative to the stem cell treatment to be used in the future. Our goal is to use FIDAP and GAMBIT software solutions and mesh to compare the effectiveness of glycerol, propylene glycol, and DMSO, three commonly used cryopreservatives, in order to determine the cryopreservation agent that will maximize viability of umbilical cord stem cells.

title: Transdermal Scopolamine Drug Delivery Systems for Motion Sickness
abstract: Transdermal drug delivery systems are involved in the continuous administration of drug molecules from the surface of the skin into the circulatory system. Such systems have proved advantageous for delivery of certain drugs, such as scopolamine, nicotine, nitroglycerine, and estradiol. Compared with oral administration, transdermal drug delivery offers better uniformity of drug concentrations in plasma throughout their duration of use. Scopolamine is the active ingredient in motion sickness medication that targets the nerve fibers in the inner ear. The scopolamine patch is effective for about three days, longer than if administered orally which is effective for only several hours. One of the main restraints of this transdermal system is its absorption through the skin, especially through the stratum corneum, its outermost part. This study examines the rate of diffusion of transdermal scopolamine across the skin and into the systemic circulation. Our objective is to optimize the drug delivery by way of a scopolamine patch by minimizing absorption rates, while maintaining its advantage of a long-term effect. A comparative study of the effects in the presence of penetration enhancers were undertaken to show how steady state is approached at different rates. The model we used does offer certain limitations, as diffusivity values specific to human skin and scopolamine are not readily available.

title: A Study of the Role of Therapeutic Contact Lenses in Drug Delivery
abstract: Glaucoma is an optical condition caused by pressure build up in the eye and is the leading cause of blindness. Current methods to treat glaucoma include medicated eye drops and oral medication, which are both inefficient methods of administration. Most of the medication in eye drops does not reach the target tissue. In addition, when taken orally, much of the drug circulates in the bloodstream instead of reaching the eye. This is a potential problem since drugs used to treat glaucoma, such as timolol maleate, are also prescribed to elevate hypertension. To avoid possible side effects, researchers have developed a novel method of drug delivery that involves enclosing the drug in the contact lens to be worn directly over the eye. The drug-encapsulated contact lens can deliver the drug to the target tissue more effectively. This paper focuses on the drug delivery of the therapeutic contact lens in the treatment of glaucoma using a computer-simulated model created by FIDAP, a computational fluid dynamic software. The problem is modeled as mass transfer of timolol maleate over four layers (lens, tear, cornea, and aqueous humor) of an axis-symmetric cylindrical slab. Results show that with an initial concentration of 7 mg/g contact lens in the contact lens, the minimum effective concentration of 1.8 ?g/mL is achieved in the aqueous humor layer after 45 minutes. The contact lens continues to deliver the drug into the eye at above this concentration for another 75 minutes before dropping below the minimum effective concentration at 1.5 hours. Sensitivity analysis shows that cornea diffusivity is the most important parameter in the solution.

title: Assessing the Effects of Icing the Body for 20 Minutes
abstract: Icing is one of the most inexpensive and convenient treatments available to reduce inflammation in sore and injured muscles. A commonly purported icing regimen follows a ?20 minutes on, 20 minutes off? cycle, so we investigated how much skeletal muscle cools during the 20-minute icing period. To model the temperature distribution, we used an axisymmetric geometry consisting of five layers: the ice, a plastic bag, skin, subcutaneous fat, and muscle. Our initial results showed cooling of the most superficial muscle tissue by approximately 15oC. We found that changes in properties such as density, specific heat, and conductivity did not affect temperature contours at the 20-minute time point; however, heating via perfusion, which was initially neglected, had a substantial effect on the final results. When blood flow was introduced into the model, the temperature of superficial muscle decreased only 3.5oC. We thus conclude that although icing is an effective means of cooling superficial layers of muscle, it is not particularly efficacious at increasing depths.

title: Heat Transfer in Laser Tumor Excision
abstract: Cancer is an ongoing disease that is present in a majority of the population. Laser surgery provides minimally invasive techniques to excise tumors in humans. This method allows quicker recoveries and fewer complications. This study analyzes the effectiveness of excision of tumor tissue using a CO2 laser. By using computer aided design and finite element analysis, we model a cylindrical tumor tissue with 0.3cm in diameter and height. A flux of 282mmW from the laser and a convection coefficient of KmmW???26105

were applied when designing this model. Our results produced temperature contour plots at several time intervals, all showing precise laser excision with minimal inadvertent tissue damage (less than 0.006 mm in depth after excising approximately 0.15 mm of tissue in depth). Sensitivity analysis indicate that changes in material properties such as conductivity, convection, specific heat, density, and laser power have minimal affects on the temperature profile.

title: Protecting Orange Saplings from Irreparable Frost Damage
abstract: Nocturnal frost and freeze damage can have a major impact on the survival and fruit production of young citrus trees. When temperatures fall below -4oC irreparable damage occurs. Because of this damage, many methods, including insulating sapling trunks and building soil banks have been used to help reduce the rate at which these trees lose heat in sub-zero conditions. This study focused on the effect a combined insulation-and-metal-stake method has on preventing frost and freeze damage of Washington Navel Orange saplings by looking at increase in trunk temperature using this system and comparing it to trunk temperatures in both an insulation only system and a bare tree system. It was found that the rod had little effect on trunk warmth but trunk insulation helped significantly ? the thicker and denser the insulation, the better.

title: Ortho Evra: How Effective is the Patch in Women of Varying Weight
abstract: This study researched the birth control patch, Ortho Evra and the diffusivity of the hormones, ethinyl estradiol and norelogestromin, into the body through the epidermis. We modeled that all of the species that diffused through the epidermis was completely absorbed into the body. We found that our model validated the amounts given by Ortho Evra for drug release. However, many of the constraints and boundary conditions were taken from the Ortho Evra research information. Our study also analyzed the effectiveness of the hormone in women of varying weight, from 120 pounds to 198 pounds. Results indicated that the patch becomes less and less effective with increasing adipose tissue. This increase in adipose tissue results in a decreasing diffusivity value for the epidermis. Our study also researched the effects of incorrect usage of the Ortho Evra patch. We modeled the scenario of the patch falling off after a given time and the continued effectiveness of the drug. Our values imply that if the patch falls off the woman is not protected. The woman must restart the cycle in-order to reach steady state, which provides the needed amount of drug to be effective.

title: A Cryosurgical Approach to Lung Cancer
abstract: Lung cancer is the second leading cause of death in the United Statesi, presenting the need for more refined treatment options than traditional invasive surgery and chemo- and radiation therapy. This study investigates the use of less-invasive cryosurgery to effectively freeze and kill a cancerous lung tumor, 3mm in diameter, while minimizing peripheral tissue damage. A single, liquid-nitrogen filled probe is inserted into a lung tumor and maintained at a constant temperature of -190?C. The freezing front is monitored to

ensure cancerous cell death and prevent excessive damage to the surrounding healthy tissue. Based on data obtained by analyzing probe temperature, contact time and model sensitivity to variations in biomaterial properties, recommendations are made for surgical implementation: an initial contact time of 6 minutes followed by successively shorter application times. Additionally, further study designs are discussed to improve the quality of this treatment method and to ensure target outcomes with respect to tumor cell death and protection of healthy lung tissue.

title: Diffusion and Binding of Radio-Labeled Antibodies in a Tumor
abstract: With the decreasing cost of monoclonal antibody production, radioimmunotherapy (RIT) has rapidly emerged as one of the more promising methods of treating cancer cells. RIT makes use of radio-labeled monoclonal antibodies to detect and deliver controlled doses of radiation to malignant cells. The primary advantage of this method is that damage to normal, healthy tissue is minimized. We investigated the use of radio-labeled antibodies as a method of tumor destruction. Our primary interests were the rate of antibody diffusion into the tumor, the antibody binding kinetics, and the overall effectiveness of radioimmunotherapy given the rate of radioactive decay. By modeling the concentration of bound antibody with respect to time, we were able to optimize tumor destruction while minimizing the damage to the surrounding tissue. Our results show that a computer simulation using FIDAP is a time-saving, cost-effective method of obtaining quantitative results about the binding kinetics of antibody to tumor. In addition, we determined that while the binding specificity plays an important role in ensuring proper binding to the tumor, the rate of antibody to antigen complex formation does not affect the treatment and that this process is limited by diffusion. Given this fact, we recommend that low molecular weight antibodies be used because they will typically have higher diffusivities. In an example case of metastatic melanoma, we found that 4.33 mg of 188Re-6D2 complex would destroy the tumor in our model.

title: Efficient Retinal Ganglion Cell Coding and the Statistics of Natural Scenes
abstract: The structure of the early stages of the visual system is thought to be well-matched to the particular statistics that characterize the visual environment. Retinal ganglion cells in vertebrates and analogous retinal units in invertebrates show center-surround receptive field organization. Given that center-surround organization is observed across species (in multiple modalities as well), we seek a general explanation of the purpose of this unit, specifically in terms of spatial visual coding. Ganglion cell coding has been assumed to be well-matched to only the most rudimentary statistical regularities of natural scenes, namely the pairwise correlational structure of images. It has been proposed that ganglion cell receptive fields, when convolved with natural images, are theorized to produce a flat or whitened power spectrum for a range of frequencies. If the visual system were performing a spatial decorrealtion of ganglion cell outputs (presumably through lateral inhibition), it would give this type of whitened response (Atick and Redlich, 1992). But ganglion cell outputs are found to be highly correlated and furthermore, decorrealtion is insufficient to predict center-surround receptive fields. In this thesis, we present a coding strategy that employs phase-randomized receptive fields that produce the same degree of whitening as those modeled after real ganglion cells, with center-surround organization. The phase-randomized receptive fields do not resemble real ganglion cell receptive fields suggesting that there are other goals to ganglion cell processing. Results indicate that the sparseness of the

responses could be another goal of retinal coding since the center-surround receptive fields give a more sparse response than do the phase-randomized ones. The flat (whitened) response power spectra could be related to what has been called response equalization (Field and Brady, 1997), which refers to the notion that cells sensitive to different frequencies should have uniform response magnitudes. Using a vector-length sensitivity measure, we find that data recorded from single ganglion cells across the macaque retina (Croner and Kaplan, 1995) show a degree of response equalization (at least for parvocellular ganglion cells). Nonlinearities in the retina may also be related to efficient coding goals.

title: The Design of Wearable Technology: Addressing the Human-Device Interface Through Functional Apparel Design
abstract: Wearable technology, as a new application environment for electronic and computing devices of all kinds, presents many new challenges to designers. The fields of human-computer interaction and functional wearability must each address new problems in the design of wearable technology. Wearable technology also introduces new social concerns, as it can mediate the ways in which an individual is perceived by others, interacts with others, and manages his/her own physical space.
Because the field of wearable technology is very new, the design of wearable technology is still relatively unexplored. The dominant design culture in current wearable technology research, that of electrical engineering and computer science, is unused to addressing variables related to the human body, mind, and social interaction. Good design choices for wearable technology depend on understanding and acknowledging the wide array of interdisciplinary variables that affect user interaction with a wearable device. The functional apparel design culture brings an interdisciplinary approach to wearable technology design, and its structured design process offers designers a means of organizing and addressing issues, and identifying new variables to be considered in future work. This thesis seeks to use the functional apparel design process to approach the new variables involved in the interface between the body-mounted device and the human user in three areas: an input device (a bio-monitoring bra), an output device (a shoulder pad vibrotactile display), and the aesthetic and psychological issues of visual representation of technology (a set of massage shirts). These projects address physical, cognitive, and social user needs in wearable technology.
The development of the shoulder pad vibrotactile display sought to create an intuitive, visually subtle, physically comfortable tactile display device within a standard garment insert, using the volume of the shoulder pad as an integration space. The evaluation process found the use of a pre-existing garment space such as the shoulder pad to be successful for the integration of electronics, and the device to be perceptible at a low level of resolution.
The bio-monitoring bra study evaluated several variables involved in the use of garment-integrated contact (not adhesive) electrodes for bio-monitoring, an input modality that creates a low cognitive load for the user. Garment-integrated electrodes were designed to replace the medical standard adhesive electrodes, to increase the physical and social comfort of the user. Contact electrodes were tested in both an EMG (muscle activity) configuration and in an ECG (heartbeat) configuration. The ECG configuration recorded a useable signal during periods of low activity level, but the EMG configuration was not able to capture useful muscle activity data.
A set of massage shirts was developed to investigate the varying social needs of users regarding the visual display of garment functionality. Two focus groups were conducted, and an application was chosen (shoulder and back massage) that was attractive and useful to subjects with a wide variety of personality types and aesthetic tastes. Three prototypes were constructed, with the same vibrating shoulder and back massage, but with the embedded technology concealed or displayed to varying degrees. These prototypes were evaluated,

to determine the relationship between subject self-perceived personality and desire to conceal or display technology. Results showed the application to be attractive to most users, and aesthetic needs to be quite varied, even within an individual.
The functional apparel design process, as well as the knowledge and intuition about the body interface gained from the study of functional apparel design can help to broaden the scope of interdisciplinary variables considered in the design of wearable technology, and thereby produce a more successful design.The College of Human Ecology, Cornell University

title: STATIONARY AND NON-STATIONARY CASCADED INTERACTIONS IN QUADRATIC NONLINEAR OPTICAL MEDIA: THEORY AND APPLICATIONS
abstract: Committee members: Frank W. Wise, Albert Sievers, and Tomas Arias This thesis presents experimental and theoretical investigations of processes involving the propagation of short optical pulses in second order nonlinear materials. Since pulse propagation in these materials involves the nonlinear coupling of fields at different frequencies, the dynamics are rich, supporting a wide variety of nonlinear processes.
In the limit that an effective Kerr nonlinearity is produced, we demonstrate compensation for cubic nonlinearities in space and time with negative Kerr-like quadratic phase shifts. Self-focusing and self-phase modulation from Kerr nonlinearities typically limit the energy and beam quality from high power lasers, and their compensation allows for significant improvements in both parameters.
We next present theoretical results on the formation of optical solitons in quadratic media --- fields of light that propagate stably (or ``breath'' periodically) due to a robust balance between linear broadening and nonlinear confinement. We are interested in multidimensional solitons in space and time, with the eventual goal of producing ``light-bullets:'' fields confined in all transverse dimensions. Spatiotemporal solitons provide a natural system in which to observe new effects related to soliton propagation and interactions, with direct applications to optical signal transfer and processing. Recent experiments by our group demonstrate quadratic solitons in time and one spatial dimension, but are not extendible to three-dimensions due to the material systems used. We theoretically demonstrate a quadratic system in which light-bullets are possible and point a way to their observation. This is the only currently recognized optical system where stable light-bullets are predicted.
Finally, we present a new type of cascaded interactions: nonlinear \emph{frequency} shifting in the limit in which temporal walkoff between the nonlinearly coupled fields significantly affects their propagation dynamics. Previous applications of cascaded nonlinearities saw temporal walkoff as detrimental and found ways to mitigate its effects. We develop a theoretical model for cascaded interactions with significant walkoff and show that non-instantaneous nonlinear responses are possible, producing controllable nonlinear frequency shifts with strong analogs to Raman-scattering in cubic materials. These frequency shifts are analyzed theoretically and experimentally and their applications from low energy frequency shifting for optical communications to compression of high energy pulses are discussed and demonstrated.National Science Foundation, National Institutes of Health, Binational (U.S.-Israel) Science Foundation

title: Effects of a Multitouch Keyboard on Wrist Posture, Typing Performance and Comfort
abstract: Alan Hedge, Geri Gay
The design of computer keyboards is rapidly evolving as portable computing becomes increasingly ubiquitous due to wireless networking and the increased popularity of personal digital assistants and notebook computers. However, there is a balance between mobility and productivity, in terms of text-entry accuracy and speed, which needs to be maintained as computer keyboards become smaller and slimmer through the introduction of ultra low-profile designs. In addition, the ergonomic benefits, in terms of the reduction of awkward wrist postures and user comfort, of ultra-low profile designs are unclear.
This study tests a new prototype ultra-low profile MultiTouch keyless keyboard (MTK) that uses a MultiTouch surface to create an extremely thin typing environment that requires no force to register a keystroke and allows mousing and gestural input on the same surface. In this study, the MTK was tested against a conventional keyboard (CK) for typing speed, accuracy, wrist postures and user comfort. It was hypothesized that the lack of key travel would increase speed and accuracy, while the ultra-thin design would reduce the amount of wrist extension, which could decrease the risk of a wrist injury or other hand and wrist musculoskeletal disorder. Finally, it was hypothesized that there would be a significant short-term learning effect on typing speed and accuracy for the MTK.
A laboratory experiment was conducted with 6 males and 6 females typing using two QWERTY keyboard designs: a CK and a MTK. Subjects visited the lab for 1.5 hours for 2 non-consecutive days in the same week, for a total of 3 hours. Each visit consisted of eight randomly assigned 7.5-minute typing tasks of text passages of similar difficulty and identical length.
Quantitative measures of typing speed and accuracy were collected using Typing Quick and Easy 13.0 and qualitative measures of user preference and comfort were gathered by self-report questionnaires. A wrist glove electrogoniometer system was used to record right-hand wrist positioning data, which was analyzed to assess the risk of injury. The two keyboards were evaluated in a repeated measures within-subjects factorial design.
Subjects, typed slower ($F_{1,11} = 41.86$, $p=0.000$) and less accurately ($F_{1,11} = 23.55$, $p=0.001$) on the MTK during the typing tasks. Subjects preferred the CK and reported a higher level of ease ($F_{1,11} = 49.732$, $p=0.00$) and enjoyment ($F_{1,11} = 51.129$, $p=0.00$) during its use.
Mean wrist extension was lower for the MTK ($F_{1,11}= 10.205$, $p=0.000$) while radial and ulnar deviation did not differ significantly between the two keyboards. The MTK had a lower percentage of highest-risk wrist extension ($F_{1,11}= 6.437$, $p=0.028$), and conversely, a higher percentage of neutral wrist posture ($F_{1,11}= 12.947$, $p=0.004$).
A significant positive linear trend was observed across the within-subjects scores for speed ($F_{1,11}= 9.308$, $p=0.011$) and accuracy ($F_{1,11}= 11.903$, $p=0.005$) across tasks in the MTK condition.
Limitations to this study include practice effects, due to the naive subjects' lack of training on the MTK and the limited duration of exposure to this novel keyboard. Fatigue effects may have also been a factor, even though the experimental conditions were spread out over two non-consecutive days in the same week.
Future research directions include additional testing of the unique mousing and gestural capabilities of the MTK. Other research suggests that practice and extended exposure to the MTK may raise performance to comparable levels associated with CK devices.College of Human Ecology, Cornell University

title: Improving Machine Learning Approaches to Noun Phrase Coreference Resolution
abstract: Human speakers generally have no difficulty in determining which noun phrases in a text or dialogue refer to the same real-world entity. This task of identifying co-referring noun phrases --- noun

phrase coreference resolution --- can present a serious challenge to a natural language processing system, however. Indeed, it is one of the critical problems that currently limits the performance of many practical natural language processing tasks.
State-of-the-art coreference resolution systems operate by relying on a set of hand-crafted heuristics that requires a lot of time and linguistic expertise to develop. Recently, machine learning techniques have been used to circumvent both of these problems by automating the acquisition of coreference resolution heuristics, yielding coreference systems that offer performance comparable to their heuristic-based counterparts. In this dissertation, we present a machine learning-based solution to noun phrase coreference that extends eariler work in the area and outperforms the best existing learning-based coreference engine on a suite of standard coreference data sets. Performance gains accrue from more effective use of the available training data via a set of linguistic and extra-linguistic extensions to the standard machine learning framework for coreference resolution.

title: The role of true finiteness in the admissible recursively enumerable degrees
abstract: When attempting to generalize recursion theory to admissible ordinals, it may seem as if all classical priority constructions can be lifted to any admissible ordinal satisfying a sufficiently strong fragment of the replacement scheme. We show, however, that this is not always the case. In fact, there are some constructions which make an essential use of the notion of finiteness which cannot be replaced by the generalized notion of alpha-finiteness. As examples we discuss both codings of models of arithmetic into the recursively enumerable degrees, and non-distributive lattice embeddings into these degrees. We show that if an admissible ordinal alpha is effectively close to omega (where this closeness can be measured by size or by cofinality) then such constructions may be performed in the alpha-r.e. degrees, but otherwise they fail. The results of these constructions can be expressed in the first-order language of partially ordered sets, and so these results also show that there are natural elementary differences between the structures of alpha-r.e. degrees for various classes of admissible ordinals alpha. Together with coding work which shows that for some alpha, the theory of the alpha-r.e. degrees is complicated, we get that for every admissible ordinal alpha, the alpha-r.e. degrees and the classical r.e. degrees are not elementarily equivalent.

title: Synthesis of Translinear Analog Signal Processing Systems
abstract: Even in the predominantly digital world of today, analog circuits maintain a significant and necessary role in the way electronic signals are generated and processed. A straightforward method for synthesizing analog circuits would greatly improve the way that analog circuits are currently designed. In this dissertation, I build upon a synthesis methodology for translinear circuits originally introduced by Bradley Minch that uses multiple-input translinear elements (MITEs) as its fundamental building block. Introducing a graphical representation for the way that MITEs are connected, the designer can get a feel for how the equations relate to the physical circuit structure and allows for a visual method for reducing the number of transistors in the final circuit. Having refined some of the synthesis steps, I illustrate the methodology with many examples of static and dynamic MITE networks. For static MITE networks, I present a squaring reciprocal circuit and two versions of a vector magnitude circuit. A first-order log-domain filter and an RMS-to-DC converter are synthesized showing two first-order systems, both linear and non-linear. Higher order systems are illustrated

with the synthesis of a second-order log-domain filter and a quadrature oscillator. The resulting circuits from several of these examples are combined to form a phase-locked loop (PLL). I present simulated and experimental results from many of these examples. Additionally, I present information related to the process of programming the floating-gate charge for the MITEs through the use of Fowler-Nordheim tunneling and hot-electron injection. I also include code for a Perl program that determines the optimum connections to minimize the total number of MITEs for a given circuit.NSF Career award CCR-9984625

title: Conservation and Change: A Comparison of In-situ and Ex-situ Conservation of Jala Maize Germplasm in Mexico
abstract: Conservation of agricultural genetic diversity is necessary as a source of variation for breeding and selection efforts. Traditionally, conservation efforts focus on the maintenance of diversity both in genebanks (ex-situ) and on farm (in-situ). This study takes an interdisciplinary approach to understanding in-situ and ex-situ conservation of Jala, a gigantic Mexican variety of maize (Zea mays).
To understand the social and policy context of Jala farmers? conservation decisions, a formal, random survey of 79 households was undertaken. In the past, 77% of farmers grew Jala. Today, 19% of farmers plant Jala on only 5% of the cultivated maize area. Jala growers are ?generalists,? older farmers, seed keepers with larger landholdings, diversified in many income-producing activities, with small Jala plots for household consumption and local sale; or ?specialists,? younger farmers, less likely to save seed, with smaller landholdings, heavily (75% of area) committed to Jala. To date, Jala has been effectively conserved in farmers? fields; conservation will likely continue as long as farmers have an economic incentive to do so.
To understand the genetic effects of in-situ and ex-situ conservation, a diversity study was performed using 22 microsatellite (SSR) markers. Populations studied included Jala from farmers? fields, genebank Jala, other maize races, and teosinte (Zea spp.). Farmers? Jala populations were highly diverse but not highly differentiated (Fst <0.05), indicating the unit of conservation is likely the valley, not an individual farmer. Older Jala genebank populations were less diverse and more differentiated from recent Jala, perhaps due to genebank collection and regeneration methods. Jala?s allelic profiles remained stable from 1944 to 1999. Therefore, Jala appears to have been well-conserved both in-situ and ex-situ.
By resampling the above data (1000 bootstraps), optimal sample size was evaluated. The number of individuals for accurate measurement of allele number (An), gene diversity (He) and population differentiation (Fst) were small. Unexpectedly, population category?whether Jala from the genebank or teosinte?had little effect on optimal sample size.
Studying populations derived from advanced generations of the hybrid variety Dekalb 880 showed gene flow in the valley. These populations represent a reservoir of conserved traditional Jala genetic material.

title: When it comes to faces bad information may not be so bad: The effects of post-event information on line-up identification
abstract: Master's thesis in the field of Human DevelopmentThis study sought to replicate and extend what little is known about the effect of misleading post-event information (aka the misinformation effect) with regards to facial identification. One-hundred eleven undergraduate students viewed a video of a staged crime and were then given newspaper articles containing misleading, non-misleading, or no information about

the appearance of the perpetrator. Participants were then tested with either a target-absent line-up, where all individuals matched the misleading description of the perpetrator, or a target-present line-up, where all individuals matched the non-misleading description. Two main findings were obtained. First, misinformation did not impair line-up performance. However, participants receiving any (even misleading) facial information outperformed those participants receiving no information. These results suggest that in some cases, verbal misinformation may facilitate memory. Furthermore, they suggest that while perceptual misinformation may not easily impair visual memory, contextual information can.Funded through a grant from the The College of Human Ecology Graduate Student Research Awards Fund.

title: Electron Transport in Molecular Transistors
abstract: In this thesis I will describe the conductance properties of certain organic molecules.
I will first show that two metal electrodes can be fabricated with a nm-scale gap between them by causing electomigration-induced failure in a nanoscale wire. These two electrodes are separated by a few nanometers from a metallic gate electrode. Organic molecules can be incorporated into the gap between the electrodes creating a transistor geometry.
Transport measurements on metal-organic complexes at low temperatures show Coulomb blockade and Kondo-assisted tunneling. Using the specially designed molecule C$_{140}$, I have studied the coupling between the vibrational modes of the molecule and electron flow through transistors made from it.
I have also been able to make magnetic electrodes to pass spin-polarized current through molecules. Using this, I have studied the coexistence of the Kondo effect and ferromagnetism in the electrodes.
I have also modified the technique to have a mechanically adjustable distance between the two electrodes, which is useful for studying the influence of the contact on the conductance of a device.

title: Herbivore resistance in inavasive and native Myriophyllum spicatum and Myriophyllum heterophyllum
abstract: Committee members: Nelson Hairston Jr., Paul Feeny, Elisabeth GrossInvasive plant species are increasing worldwide and often have significant impacts on local ecosystems. Many attempts have been made to use augmented herbivore populations as a biological control of nuisance populations, however, the success of these efforts has been variable. One character which can affect the success of these biological controls is the expression of plant herbivore resistance. In this study I examined inducible and constitutive herbivore resistance in native and invasive samples of the aquatic angiosperms, Myriophyllum spicatum and Myriophyllum heterophyllum.
M. spicatum is native in Europe, Asia and north Africa and invasive in much of North America. When fed on by the ecologically significant herbivore, Acentria ephemerella, M. spicatum plant tips changed from green to red with a simultaneous structural change from closed upward pointing leaves to open drooping leaves. A similar response was observed in this study when native and invasive M. spicatum plant tips were exposed to jasmonic acid, a plant hormone known to stimulate the expression of plant defensive genes. A. ephemerella fed plant tips exposed to jasmonic acid had reduced growth compared to individuals fed unexposed plant tips indicating the induction of herbivore resistance. Not all of the herbivore resistant traits we examined, however, were induced by jasmonic acid. Total phenolics and tellimagrandin II concentrations were not affected by

jasmonic acid and changes in nitrogen concentrations were inconsistent. Tissue reddening, in part caused by decreased chlorophyll and increased anthocyanin concentrations, was consistently induced and may affect the visibility of herbivores in the field. However, this trait can not explain the reduced herbivore growth so it is likely that other herbivore-resistant traits, not examined in this study, were induced in M. spicatum.
M. heterophyllum is native to North America (except New England) and has invaded many New England and European lake ecosystems. When exposed to jasmonic acid in this study, concentrations of total phenolics, and an unknown phenolic compound were increased and nitrogen concentrations were decreased. These induced plant tips reduced the growth of feeding A. ephemerella. This response, however, was only observed in German (invasive) M. heterophyllum and not in samples from Maine (invasive) or New York (native). The constitutive expression of traits presumed to confer herbivore resistance was also significantly different among invasive and native populations. Maine had significantly higher concentrations of total phenolics and the unknown phenolic was only present in German M. heterophyllum. These differences in constitutive and inducible herbivore resistance among native and invasive M. heterophyllum populations may be a result of rapid evolution of invasive populations or their hybridization with native Myriophyllum species.
The constitutive and inducible herbivore resistance of M. spicatum and M. heterophyllum shown in this study would have a negative impact on biological control species which has not previously been considered by lake managers. Furthermore, differences in the expression of herbivore resistance among invasive and native populations of M. heterophyllum may partially explain the variable success of this invasive species.

title: An experimental study analysing effect of communication medium and motivation on deception detection in interpersonal dyadic interactions
abstract: Jeffrey T. Hancock, Joe Walther, Michael ShapiroThis thesis reports an experimental study that examines the role of communication medium and liar motivation on deception detection. Participants were randomly assigned to one of two dyadic communication conditions, text-based instant messaging or face-to-face, and to one of two motivation conditions, high or low. Participants engaged in a discussion of four topics, in which one participant was deceptive during two topics and truthful during the other two. No main effect of communication medium or motivation level was observed. However, an interaction effect suggests that highly motivated liars interacting in an instant-messaging medium were the most successful in deceiving their partners. The implications of these results are discussed both in terms of the elimination of nonverbal cues and the potential advantages offered by text-based communication settings to the motivated liar.

title: Open Pollinated Corn Variety Trials and a Discussion of the Practical Implications for Open Pollinated Corn in Small Scale Whiskey Production
abstract: The goal of this study was to assess the feasibility of producing open pollinated (O.P) corn varieties as a grain source for the production of specialty whiskies. Low profit margins on corn grain as a commodity make it difficult for small to medium size farmers to grow corn competitively. Such farmers could benefit from a cash crop that could offer a higher profit margin. There is current popular interest in heirloom (old-time) grains, including O.P varieties. This may provide an opportunity for a distiller to develop a market for a specialty whisky using O.P. varieties. An advantage for O.P corn as a specialty crop for corn growers is the

similarities in equipment, cultural practices, and inputs. No major conversion is needed.
Field studies were initiated to determine the production potential and reliability of O.P. varieties in New York environments, and to identify the best varieties. Comparative yield trials were conducted over two growing seasons in various locations. Varieties were selected on the basis of anticipated adaptation to New York growing conditions, potential for grain production and commercial availability of seed.
In 2001, seventeen open pollinated varieties along with a modern hybrid check were tested at Aurora, (central) and Kingston, (eastern), NY. In 2002, twenty varieties were planted at Aurora. Those considered earlier varieties were also planted at Bliss, (western). Also, in 2002, later varieties were planted at Kingston, and Pittsford, (western).
All trials were set up in randomized complete block designs. Treatments consisted of two adjacent rows of each variety with approximately 36-40 seeds planted within each block. Each trial consisted of three blocks. The plots were thinned to a density of 18,000 plants/acre.
Several major obstacles were observed First, yields of O.P. varieties were lower and more variable than yields of hybrids. The mean corn yield in bushels for New York State is 100.7 bu/acre (www.nass.usda.gov) averaged over the three years. (1999-2001). Many of the varieties in these trials occasionally performed at or above this level, but none consistently, except the hybrid checks. Stalks were also weak, blowing down in winds, and making harvest difficult. Perhaps most significantly, the data showed wide variation in variety performance between years and locations, even among the same varieties.
Premium alcoholic beverage producers could tolerate high O.P. grain costs if they could develop a market for a high value specialty whiskey featuring an O.P. corn source. However they would need reliable grain supplies. In these studies O.P. corn production was erratic, and not dependable from year to year, or site to site. This lack of dependability would present an unacceptable business risk.
One possible solution might be to develop a product based mostly on readily available, inexpensive hybrid corn grain, mixed with a small amount of open pollinated grain.
If a business plan could be developed that protects against fluctuations of availability, the concept of using O.P. corn to differentiate a small batch premium alcoholic beverage might have potential for success. This could provide employment in the processing, distilling and bottling processes. And O.P corn might provide a profitable niche crop for a limited number of corn growers.

title: Anatomy, Industry, and the English Canzonet (1770-1820): Placing Women in the Private Sphere
abstract: Committee: Neal Zaslaw, Chair; Judith Peraino; Annette Richards; James WebsterIn late 18th-century England, scientists and artists alike sought doctrines that would elaborate a set of "fundamental" feminine attributes justifying women's restriction to the private sphere. Through musical analysis and readings of contemporary literary and popular-print culture, this dissertation shows how the English canzonet (a genre of domestic song known today primarily through Haydn's two sets, but which was then widespread and popular) reflected medical and industrial discourses about gender, and through these "public sphere" discourses, helped to fix women within the private sphere.
Part One describes the social circles in which cross-fertilization of musical and scientific-industrial ideas took place. There, canzonets were understood not only to hold domesticating properties, but to communicate "authentic" sentiments, making them ideal vehicles for the expression of the "truth" about women.
Part Two examines intersections between canzonets and the newly-mobilizing discipline of anatomy, describing a fascination with "beautiful death" and "uncertain death" as common interests between the two cultural realms. These conceptions of death combined to assert an ostensibly elevated status for women but concomitantly defined them in terms of committed love that survived even the end of life. In this context,

sighs, both textual and musical, drew attention to women's bodies, opposing them to reason and tying them to domesticity.
Part Three considers canzonets in light of tensions between industrial and pre-industrial conceptions of time. The linkage in song between women and time, when time itself was taking on features of commodification, resulted in an endlessly reiterated performance of women's reification as an object of consumption, an apt maneuver for the "marriage market" setting of the drawing room. In sung nostalgia for "old" time, meanwhile, women were apparently empowered to resist the incessant forward motion of mercantile time and the perpetual demand for originality characteristic of the industrial age. And yet, the fact that this notion of time was nostalgic and old-fashioned signaled women's disenfranchisement from a progress-centered, public-sphere orientation.
Part Four chronicles and explores the significance of the genre's migration to the realms of masculine, virtuoso display and devout church music. The Appendix provides a checklist of canzonets held in the British Library.

title: Probing and Modeling Voltage Breakdown in Vacuum
abstract: Hasan Padamsee, David Rubin, David Hammer Voltage breakdown limits many technologies that rely on strong electric fields. Although many kinds of voltage breakdown have been well-explained, voltage breakdown in vacuum--the sudden transition from vacuum insulation to vacuum arc--remains relatively poorly understood. Despite the importance of vacuum insulation, technology has hardly improved breakdown voltages in the last ninety years. This work describes experiments in vacuum breakdown, as well as computer simulations of the initial stages of breakdown.
A better understanding of voltage breakdown could particularly benefit particle accelerators used for high energy physics experiments and radiation sources, which require the highest attainable electric fields in the microwave resonators that accelerate particles. Despite some differences, voltage breakdown in microwave resonators shares some features with breakdown in DC vacuum gaps (diodes). In both cases, the localized desorption of gas around an electron emission-source (e.g., field emission) could lead to breakdown. Analytical calculation shows that breakdown occurs when the product of the gas density and emission current exceed a critical value.
Voltage breakdown in vacuum results from the interaction of the electric field and the electrodes. Using a scanning electron microscope, with energy dispersive x-ray spectroscopy (EDX) and Auger electron spectroscopy (AES) to identify surface constituents, we found that breakdown occurs often at the site of foreign particles on the cathode, usually leaving only a very small trace of the original material. At the breakdown site we frequently found small craters, surrounded by a large starburst-shaped pattern; surface analysis suggests that during breakdown, ions bombard the surface within the starburst region and sputter away surface contaminants and oxides. In general, particulate contamination on the cathode determines the breakdown voltage, independent of the cathode material or the thickness of the insulating surface oxide; however, the oxide thickness does change the nature of the starburst and the damage done to the surface during breakdown.National Science Foundation

title: How Do I Do This in ArcGIS/Manifold?: Illustrating Classic GIS Tasks
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment.In 1988, the United States Geological Survey (USGS) created a classic document titled "The Process for Selecting Geographic Information Systems" (Guptil, et. al., 1988). The document provided an overview of the process for selecting geographic information systems, in addition to a checklist of functions that a GIS should include. The functions were broken into five separate categories: user interface, database management, database creation, data manipulation and analysis, and data display and presentation. The document became required reading for those involved in the selection of GIS, and was often used as a supplementary checklist in competitive benchmarks of GIS software. Although the document is over 15 years old, many of the functions listed are still relevant today, and represent some of the most commonly used features within GIS. In fact, the document was so forward thinking that most GIS software products are still unable to perform all the tasks listed.
Therefore, this document attempts to illustrate the GIS processes listed in the USGS document using two popular GIS software systems: ArcGIS 8.3 and Manifold 6.0. While the document does illustrate the steps required to complete the classic GIS tasks in a side-by-side format, it is not meant to be a comparison or an endorsement of either product (they just happen to be the two most popular products in our lab). Rather, it is meant to serve as a cheat-sheet for GIS professionals needing some direction in performing classic GIS functions. Many individuals are beginning to experiment with Manifold GIS, and the large user base of ArcView 3.x user continues to migrate to ArcGIS.

title: Effects of Differential Arithmetic Practice on Children's Solutions of Mathematical Word Problems
abstract: Word problems are difficult. Although children eventually master computational skills, problem solving skills remain poor through adulthood. Two different types of manipulations were attempted to affect rates of successful word problem solution. First we made changes to the word problems themselves to make them more comprehensible for students, and therefore easier to solve. Second, students were given one of two types of arithmetic practice and were compared with a third group of students who received no additional practice to determine whether such practice could assist students with solving arithmetic word problems.
First- and second-grade students were tested on three different types of single-step arithmetic word problems: a set of Compare problems, a set of six typically worded Change problems and a set of six Change problems whose wording was clarified with simple temporal, semantic and referential clarifications. These changes were intended to make the action in the problem easier to follow so students could model the problems more successfully. The percentage of students answering correctly on different problems was compared.
Students were then randomly assigned to one of two different arithmetic worksheet conditions or to a third no practice condition. Worksheets consisted of either standard arithmetic practice or computational practice requiring students to solve for something other than the result. After completing all of the worksheets, students were tested on a set of word problems arithmetically identical to those presented five months earlier.
Results of clarification were mixed. Students had somewhat more difficulty with solve-for-result problems which are traditionally the type of word problems at which students perform best. Students were more successful at solving clarified solve-for-start-set problems. There was also a curious trend for students to be more successful at subtraction problems than addition problems of the same type. This was more pronounced with clarified problems.
Second-grade students showed no effect of worksheet condition. First-grade students who were assigned to the non-canonical worksheet condition demonstrated a marked improvement on typically worded change

problems. Reasons why the arithmetic practice did not also have an effect on clarified problems need to be explored further. Michael J. Spivey, Chair; James Cutting; Robert Johnston; Marianella Casasola

title: A Study of Fluorescent Nanoparticles: Quantum Dots and Silica Dots
abstract: Optical techniques have here been employed for the study of two types of nanoscopic fluorescent probes, quantum dots and silica dots. Basic characterization of these fluorescent nanoparticles? photophysics and their capabilities have been explored utilizing the following techniques: fluorescence correlation spectroscopy, FCS, time resolved single photon counting lifetime decay measurements, and steady state absorbance, emission, and excitation measurements.
The unique properties of QDs, unmatched by any available organic fluorophore, have the potential to allow the development of FRET-based nanoscale biosensors. Unambiguous assignment of a quenching mechanism between partners as FRET may only occur through the measurement of the rate of transfer from the donor to the acceptor, this rate manifests itself as a negative amplitude component in the overall lifetime decay of the accepting partner. Two experimental regimes were executed in an attempt to identify the presence of FRET between fluorescent donor semi-conductor quantum dots surrounded by streptavidin with peak emission at 525nm (525-CdSe-ZnS QD-streptavidin) and biocytin dye acceptors chosen to have varying degrees of absorption overlap with the 525-CdSe-ZnS QD-streptavidin emission. Significant quenching of the donor, along with the acceptor, was seen when the donor was bound to the acceptor, signifying some form of energy transfer. The degree of donor quenching, illustrated by the decrease in average lifetime, corresponded with the loading ratio of the acceptor?the more acceptors present, the larger the quenching. An unambiguous assignment of the rate of transfer of excited state energy from the donor to the acceptor, signified by a negative amplitude component in the lifetime decay of the acceptor, was not accomplished.
Organic fluorescent dyes encapsulated in silica to create nanoscopic core-shell particles for use in biological applications have presented an interesting alternative to semiconductor fluorescent probes. In this experiment, an expanded core-shell morphology was surrounded by increasingly thicker layers of the siliceous shell to determine if this could control the photophysical properties of the nanoparticles. Sixteen nanoparticles were synthesized, all of distinct sizes and their photophysical properties investigated. No correlation between the thickness of the silica shell and the brightness of the particle was found. However, as the size of the particle increased the siliceous shell acted as a protective coating from potential quenchers for the TRITC dye in the center allowing molecules to stay in the triplet state for longer periods of time. title: Lewd Imaginings: Pedagogy, Piety, and Peformance in Late Medieval East Anglia
abstract: Andrew Galloway (Chair), Thomas D. Hill, Judith A. Peraino, Masha RaskolnikovThis dissertation explores clerical and lay desires for spiritual teaching and learning at the end of the Middle Ages in England, desires that, while ostensibly contemplative, carried crucial ecclesiological, political, and literary implications. Where these desires met stood the image of the unlearned lay person. This image has a history of its own; tracing it reveals many of the discourses and identities structuring late medieval society. The iconic lay person was a creature of imagination, feeling, and desire, not desire for theological proposition and dispute, but for a palpable relationship to God. Addressing that desire led in late medieval England to an astonishing

increase in clerical awareness of the laity?s spiritual needs and clerical activism in addressing those.
Learned writers invented a discourse of ?lewdness? (after the technical term for the unlettered medieval laity) according to which the pious laity were supposed to learn by reading images as the learned did by reading books. Derived from an early pope?s rebuke of an iconoclastic bishop, this assumption maintained its authority throughout the Middle Ages, regularly resurfacing in a variety of contexts, although not always in immediately recognizable forms. The pervasive authority of this dictum led late medieval theologians to expound a system of participatory meditation on events from the life of Christ as particularly suitable for the laity on account of its imaginative methods. These trappings of ?lewdness? obscured, however, the much broader clerical origins of such mystical practice, from monastic and other learned traditions, that paradoxically were adapted to how the ?lewd? laity were instructed to pursue their own uniquely intimate kind of contemplation.
This discourse of "lewdness" assumed peculiar force within the region of East Anglia (the counties of Norfolk and Suffolk along with parts of Cambridgeshire and Kent), as evidenced by its refraction in the spiritual biography of a remarkable lay woman from Bishops Lynn, Margery Kempe, and its manifestation as the common dramaturgical foundation for a collection of plays otherwise notable for their formal and generic differences. Ultimately it coalesced, ironically, with the goals of later Reformers.

title: Cosmic Strings in Brane Inflation and Superstring Theory
abstract: Observable predictions of Superstring theories are rare and important. Recent theoretical advances and upcoming experimental measurements of cosmological physics make the testing of generic predictions of string theories possible. Brane anti-brane models of inflation within superstring theory are promising as string theory descriptions of the physics of the early universe, and while varied in their construction, they can have the generic and observable consequence that cosmic strings will be abundant in the early universe. This leads to possible detectable effects in the cosmic microwave background, gravitational wave physics, gravitational lensing and pulsar timing. The string theory physics involved in the production of these defects at the phase transition at the end of inflation is reviewed herein. Detailed calculations of cosmic string interactions within string theory are also presented, in order to distinguish these cosmic strings from those in more conventional theories. It is found that cosmic strings are stable and have tensions compatible with current upper bounds and which are detectable in upcoming experiments. Interaction probabilities of these strings are found to be very different from conventional strings, providing the possibility of experimental tests of string theory.

title: GOT PERP? EYEWITNESS ACCURACY, DECISION PROCESSES, AND PRESENTATION PROCEDURES USING SEQUENTIAL LINEUPS
abstract: It was my objective to understand whether accurate and inaccurate eyewitnesses could be distinguished by their decision-making during a sequential-lineup. All eyewitnesses, except in Study 6, were shown a video-taped crime and presented with sequential lineups.
Study 1 was designed to identify the decision processes of eyewitnesses. While viewing a culprit-present lineup, witnesses were asked to ?think aloud? and later describe in writing their thoughts as they reached a decision for each photograph; five decision process statements were then created or selected from previous research. In

Study 2, the main dependent measure asked eyewitnesses to endorse all applicable decision process statements from Study 1. Factor analysis revealed a simple matching strategy containing three decision processes and a deliberative strategy with four decision processes. Accurate eyewitnesses were significantly associated with the simple matching strategy, and inaccurate eyewitnesses with the deliberative strategy.
An automatic recognition statement was added to the decision process statements. Study 3 looked at inaccurate identifications in culprit-absent lineups and found that the decision processes of inaccurate eyewitnesses did not differ regardless of having selected an innocent suspect replacement or a known innocent picture. Study 4a and 4b successfully replicated previous findings using a new set of experimental materials with different witness viewing conditions.
Study 5 demonstrated that accuracy rates could not be predictably influenced via the manipulation of witness decision processes. Witnesses forced to use deliberative decision processes were not subsequently less accurate. Witnesses forced to use simple matching and automatic processes were also not subsequently more accurate. Study 6 participants were asked to postdict witness accuracy. They were given previous eyewitness identification judgment forms and some were informed about the decision strategies found to be indicative of accuracy and some were not. Unexpectedly, informed participants did not outperform the uninformed or perform better than chance.
Studies 7 and 8 tested whether logical modifications to the sequential procedure would affect accuracy. In Study 7, only culprit-present lineups were conducted and seeing it twice before making any identification (no-ID-first-view) presentation produced significantly greater accuracy than the traditional presentation. Study 8 served as a replication and extension, using both culprit-present and culprit-absent lineups. The superiority of the no-ID-first view condition did not reach significance. The implications of Studies 1-8 for memory, face recognition and the legal system are discussed.

title: An interaction process analysis of text-based communication in an online multiplayer videogame An analysis of socioemotional and task-oriented communication in online multiplayer videogames
abstract: The present study examines the socioemotional and task-oriented content of text messages produced by players of an online multiplayer videogame. From a computer-mediated communication perspective, over five thousand messages produced by 65 players during a 2-week period were examined using Bales? interaction process analysis. The results suggest that players produced significantly more messages expressing socioemotional than task-oriented content. Of the socioemotional content that was produced, the vast majority of it was positive in nature, despite the primary game objective of fighting one another. Players' experience level also played an important role in content production. More experienced players produced significantly higher levels of positive socioemotional content than less experienced players, and they were more likely to use specialized conventions (e.g., emoticons, abbreviations, and scripted emotes). These results provide support for the social information processing theory of interpersonal computer-mediated communication in the context of graphical online multiplayer videogames. The use and modification of interaction process analysis for studying computer-mediated communication in graphical virtual spaces is discussed.

title: The USA PATRIOT Act and Archivists
abstract: This presentation, given at the Spring 2004 meeting of the New England Archivists, discusses the

impact of the USA Patriot Act on archives. First, it discusses the real, though slight, risk the Patriot Act poses for archives, especially with regard for the privacy of archival donors and users. Second, it discusses some of the concrete steps that archives can take to lessen the potential negative impact on archives. Lastly, it talks about the archival and records management issues associated with terrorism investigations.

title: Open-Access Scholarly Publishing in Economic Perspective
abstract: What is the prospect for migrating scholarly journals from paper to digital formats in a way that lowers university expenditures? Although many journals are published digitally, at least so far, the digital format complements paper, increasing university expenditures. Open-access publications that are free to readers and financed by publication fees paid by authors and their agents may both lower costs and allow scholarship to reach a larger audience. However, gains to universities may depend on open-access being qualityassured and controlled by not-for-profit publishers. Potential savings for a typical US research library might be on the order of $2.3 million per year even as the same level of effort goes to reviewing and editing published articles as at present. To launch the initiative, provosts might adopt policies to support publication fees and not-for-profit publishers might invest in start up funds for editing and marketing open-access journals.Department of Ecomomics, Vanderbuilt University

title: Developing an Institutionally-Funded Publishing Channel: Context and Considerations for Key Issues
abstract: A Report prepared for the Creating an Open Access Paradigm for Scholarly Publishing ProjectCornell's Internet First University Press (IFUP) seeks to explore the practical viability of direct institutional funding

for serial and monographic publication of an institution?s faculty research. To effect fundamental change, such an institutional funding model must not simply shift the costs from the library to other budgets within the institution. It must disaggregate and restructure the academic publishing value chain to separate the services that facilitate publication from monopolistic control of the material published. To attain this goal in practical terms, the IFUP must demonstrate a sustainable economic model and guarantee author autonomy in the choice of publishing venue. This report reviews past and current academic publishing initiatives that provide context and practical insight into how an institutionally sponsored publishing model might be designed and implemented to satisfy these essential requirements.

title: Creating a Sustainable Scholarly Communication System
abstract: The current process of scholarly publication is widely regarded as unsustainable.
Ensuring that scholarly information remains accessible to the world's scholars will require the work of a consortium of major research universities. A global consortium of research universities would have the power to negotiate a mutually beneficial relationship with cooperating publishers including permitting the open publication of preprints in disciplinary archives. This consortium could be built around a shared global electronic library constructed from components managed by individual cooperating institutions. These components built on Open Archives Initiative (OAI) compliant servers using open software (e.g. DSpace and EPrints) are currently installed at many universities. The shared library could look like an extension to an individual member's library and contain a full range of materials certified in a variety of ways by contributing institutions. In addition to publishing books, articles, course materials, videos and databases, universities could individually or cooperatively host open and subscription-funded journals in digital form. They could support open, discipline focused preprint archives and encourage faculty to publish in journals that permitted this. This system would help integrate and coordinate multiple efforts to promote open publication and enable open and not-for-profit publishers and university libraries to become partners in the scholarly enterprise, each responsible for a certain phase of the process.

title: THE CORNELL HIGH-ORDER ADAPTIVE OPTICS SURVEY FOR BROWN DWARF COMPANIONS AND RELATED INSTRUMENTATION STUDIES FOR BROWN DWARF RESEARCH
abstract: Committee Members: James Houck (chair), Peter Gierasch, Daniel Schwarz, Eanna FlanaganI begin this publication with a description of the procedures and results for the Cornell High-order Adaptive Optics Survey (CHAOS) for brown dwarf companions to stellar systems. This survey consisted of near-infrared coronagraphic observations of 80 stars out to 22 parsecs. The subsequent data analysis revealed that zero systems showed conclusive evidence for a brown dwarf companion. Accompanying Monte Carlo population simulations determined a brown dwarf companion upper limit of 9.7% for the 25-100 AU semi-major axis region. Such a value indicates, at an 89% confidence level, that the "brown dwarf desert" around stellar objects extends further than has been previously reported.
Following my descriptions of the CHAOS survey, I continue with a discussion of HD150451C, a likely white dwarf companion to the binary system HD150451AB. This object, discovered in the course of the CHAOS survey, shows infrared colors and H-band spectra consistent with a white dwarf. Common proper motion measurements confirm its classification as a physical companion. A mass estimate of 0.6-1.3 solar masses

constrains it among the population of medium to very large (i.e. approaching the Chandrasekhar mass) white dwarf stars. We discuss the implications of such a classification for the stellar system's origins and history. I conclude with a description of my work in the design, fabrication, and commissioning of WIRC, a state of the art wide-field infrared camera for the Palomar 200-inch Hale telescope. The instrument, along with the collecting power of the Palomar 200-inch Hale telescope, is currently the most powerful system in the world for wide-field infrared surveys. It presently resides at Palomar Observatory as a full-time facility instrument.

title: Dynamic Phenomena in Transport through Sub-micron Devices
abstract: This thesis considers dynamic phenomena in transport through electronic devices on sub-micron scale. It consists of two closely related parts, the first considering DC current through a quantum dot as a response to a periodic perturbation of its shape and the second, conversely, explores a finite-frequency spin wave in a ferromagnet due to a constant electric current. Both systems are very similar in their theoretical treatment by scattering matrix formalism.
The Chapters \ref{chap:2}--\ref{chap:4} consider a charge current induced by a periodic perturbation of an open quantum dot's shape. A dot being mesoscopic, its transport properties strongly fluctuate from sample to sample and therefore knowledge of full sample-to-sample distributions is essential. We consider a ``quantum pumping" regime of reservoirs in equilibrium and periodic variation of the dot's shape by AC voltages applied at the gates. Experimentally measurable first several moments of mesoscopic distribution of charge pumped in one cycle are explored.
Chapter \ref{chap:2} considers distributions of adiabatically pumped current $\bar I$ and voltage $\bar V$ and finds that even in a slow weak pumping regime they are not simply related via time-averaged conductance $\bar G$. Moreover, values of $\bar I-\bar V\bar G$ for few-channel dots exhibit strong mesoscopic fluctuations, comparable with those of $\bar I$.% and $\bar V$.
Chapter \ref{chap:3} explores mesoscopic distributions of noise and current-to-noise ratio in a weak pumping regime in a wide region of temperatures and pumping frequencies. Fluctuations of noise in the multi-channel limit $N\to\infty$ are found to be small as $1/N$. For a multi-channel system the ensemble-averaged noise is analytically found and calculated for experimentally relevant temperatures, frequencies and pumping strengths.
The Chapter \ref{chap:4} concerns the formalism of time-dependent scattering matrix theory and finds correlators of matrix elements up to the fourth order. Our findings allow a systematic treatment of various transport properties, as well as their ensemble-averaged correlations. We also compare our results with results obtained in Hamiltonian approach of Random Matrix theory.
The second part, Chapter \ref{chap:5}, considers magneto-transport through a single ferromagnetic layer. Electric current flowing perpendicular to the plane of a thin layer is shown to excite a finite frequency response in form of a spin wave. Unlike the previously known spin-torque due to a polarized current, another mechanism able to induce a destabilizing torque on a local magnetization is found. Spin-diffusion of reflected spins from one point on the normal-ferromagnet boundary to another might excite a spin wave at sufficiently strong currents. We analytically find the critical current value and discuss our results for experimentally relevant parameters. Prof. Brouwer (Cornell), NSF, Center for Nanoscale Systems

title: TESTING THE ROLE OF SCHEMATA IN THE APPLICABILITY MODEL OF FRAMING EFFECTS: A SURVEY EXPERIMENT ON THE ISSUE OF BIOTECHNOLOGY
abstract: Researchers have argued that conceptualization of cognitive mechanisms that underlie framing is vague and have proposed an applicability model to account for cognitive processes contributing to framing effects (Price & Tewksbury, 1997). The applicability model assumes the central roles of schema and views framing effects as applicability effects. In particular, it assumes that media framing will only have an effect if it resonates with pre-existing schemata held by audience members.
The study described in this thesis tests the applicability model and its assumption of relevant schemata through a two-by-two experimental design. Through a national, computer assisted telephone survey of 781 respondents, the study utilizes a split-ballot technique to measure the effects of two frames (regulation versus non-regulation) on issues related to biotechnology and genetically modified food products. A secondary manipulation, varying the order of schemata measures (frame first versus schema measures first), tests the role of schemata in framing effects. Causal attributions, attributions of responsibility, and policy opinions are measured as outcomes of the main manipulation, or framing effects. Additional variables including demographics, attention to science and technology news across three media, awareness and support of biotechnology, and ideology were collected to control for and assess other influences on the outcome variables.
Analyses included independent t-tests to look for differences between the four experimental groups. Respondents? schematic strengths were assessed through six measures. Twelve measures assessed causal attributions, responsibility attributions, and policy opinions toward regulation of biotechnology.
Results reveal that schemata are directly related to people?s attributions and opinions on issues related to biotechnology and media attention is directly related to schema development. In particular, attention to science and technology news on television, in newspapers, and on the Internet contributed to stronger Information schemata, which emphasize the importance of science and research in determining the risks and safety of genetically modified food products. Television was the only medium that was related to Regulation schemata, which emphasize regulation as a necessity to protect consumers from the effects of biotechnology and preserve the environment.
Framing effects occurred across particular schematic strength groups. Two different schematic groups were more likely to attribute risks associated with biotechnology to global causes such as the nature of science and information if they were exposed to the Non-Regulation frame, which emphasized that science and research should determine if new regulations should be made. Furthermore, respondents with stronger schemata (medium Regulation and high Information schematic strength) were more likely to agree with treatment as

the cause of risk when exposed to the Regulation frame, which argued that the FDA must require research and create regulations to protect citizens from unsafe products. However, differences in Global attributions were not found across the seven other schematic groups.
Respondents with high Regulation schemas were more likely to attribute responsibility to the government even when they were exposed to the Non-Regulation frame. Framing effects were not found for policy opinions and responsibility attribution to other groups such as non-governmental groups, trade groups and private corporations, and individuals. These results suggest that schema determine to a large extent, whether or not framing effects would occur and thus, provide some support for the Applicability model of framing effects.
Furthermore, interaction effects were found between the main manipulation (type of frame) and the secondary manipulation (order of schemata measures) for particular schematic groups. Framing of genetically modified foods influenced policy opinions for particular schemata groups that were exposed to the schema measures after the frame manipulation, indicating that the content of schema measures may have contributed further to framing effects. Question order and possible priming effects are discussed.
In sum, the results provide limited support for the Applicability model and demonstrate the need for further research into the cognitive mechanisms that underlie framing effects. Future study can further illuminate the complexity of audience schemas and their role in framing effects. Understanding of these cognitive mechanisms can be used in both development and political communication campaigns, where message receptibility will depend on audience awareness and schematic frameworks.

title: A Theory of Intergroup Antagonism
abstract: The primary purpose of this paper is to present a macro-structural theory predicting which groups in a society will be antagonistic towards which other groups, with an eventual aim of understanding why certain societies experience one type of antagonism, while other, apparently similar societies do not. Drawing on many methods of interpreting conflict, the theory argues that intergroup antagonism is caused by a threat that is generated by a change in the level of interaction or stratification within the society. Interaction and stratification also predict the groups involved in antagonistic behavior.

title: Report of the CUL Task Force on Open Access Publishing Presented to the Cornell University Library Management Team August 9, 2004.
abstract: The Task Force on Open Access Publishing was convened by Ross Atkinson in January 2004.The purpose of the Task Force is to study the information available on Open Access publishing and to provide the CUL Library Management Team with a report that addressed specific questions. Alternative publishing

models that would offer free and unimpeded access to scholarship promise both a more affordable system for academic institutions and their libraries and a more democratic one for readers and authors. The present Report examines both aspects of the Open Access promise and offers recommendations for CUL's involvement in the arena of Open Access publishing.
>>CLARIFICATION:
This Report of the Cornell University Library's Task Force on Open Access represents the Task Force's initial examination into the Open Access publishing model and its impact on the Library. On October 7, 2004 the Library Management Team reviewed the report and requested additional analysis, particularly with regard to the underlying economic model from an institutional, rather than library, perspective and more consideration of projected costs and benefits,especially when considered from a multi-institutional or consortial point of view.<<

title: Performance Analysis of Contract for Options
abstract: In this dissertation I analyze performance of the contract for options in various settings.
In the second chapter, I consider a contract for options between a supplier and a manufacturer in the presence of a spot market with uncertain spot price, limited supplier capacity, and where the manufacturer must fulfill the stochastic demand of a downstream supply-chain link in full. I model the contract negotiation as a two-stage Stackelberg game in which the supplier is the leader. I derive a closed-form expression for the optimal number of options that the manufacturer should purchase, and show the (unrestrictive) conditions under which the supplier's profit is unimodal in the reservation and exercise prices. I make observations based on analytical results and numerical experimentation to assess when such a contract is incentive compatible for the players and effective in coordinating the channel.
In the third chapter, I analyze different mechanisms that lead to channel coordination. Specifically, I show channel coordination is achieved by a contract for options when the manufacturer is the leader, when a quantity discount contract is used, and when renegotiation is allowed. I demonstrate how different coordinating mechanisms affect the allocation of the profits between the supplier and the manufacturer and give some insight on when each mechanism might be appropriate. I highlight the desirability of renegotiation as a coordinating mechanism by showing that it is robust -- coordination is achieved despite information asymmetry -- and leads to a more equitable sharing of the contract benefits than do the other mechanisms.
In the fourth chapter, I evaluate capacity investment decisions of the players in the supply chain consisting of a supplier and two identical manufacturers. I compare the performance of the linear-price contract (when the supplier must use an allocation mechanism) with that of the contract for options. I demonstrate that when the supplier sets transfer prices, the contract for options performs only slightly better than the linear-price contract, which implies that the contract for options is not always an obvious choice over the linear-price contract.

title: ENZYMATIC REGULATION OF VITAMIN E STATUS: IDENTIFICATION AND CHARACTERIZATION OF THE NOVEL TOCOPHEROL-OMEGA-HYDROXYLASE PATHWAY OF VITAMIN E CATABOLISM
abstract: Tocopherols and tocotrienols all possess to varying levels the vitamin E activity of alpha-tocopherol,

the most bioactive form of the vitamin in vivo. alpha-Tocopherol is the most abundant vitamer in vivo, potentially explaining its higher bioactivity. This is despite higher dietary levels of other vitamers. The preferential retention of alpha-tocopherol appears to be at the level of elimination. Urinary metabolites of tocopherols, with the phytyl tail truncated to a three-carbon carboxylated moiety, were reported previously. The goal of this work was to elucidate the pathway(s) by which these metabolites are formed. Incubations of tocopherols in hepatocyte culture produced all expected intermediates in the predicted pathway of catabolism of vitamin E. This pathway involves omega-hydroxylation of a terminal methyl group of the phytyl tail, followed by step-wise removal of two or three carbon units by a omega-oxidation mechanism. Analysis of microsomal enzyme activity led to the elucidation of CYP4F2 as the major P450 involved in the initial omega-hydroxylation reaction. Substrate-specificity of this enzyme was high, with activity toward gamma-tocopherol being 10-fold greater than toward alpha-tocopherol. Sesamin, known to raise plasma gamma-tocopherol to levels near those of alpha-tocopherol in vivo, was a potent inhibitor of this enzyme. Together, these data supported the hypothesis that the omega-oxidation pathway is an important regulator of vitamin E status.
Kinetic analyses revealed key features of the tocopherol molecule which govern the affinity and activity of the enzyme toward its substrates. These studies also revealed an allosteric nature of CYP4F2. The finding that alpha-tocopherol is a positive effector of gamma-tocopherol metabolism may explain why supplementation with alpha-tocopherol decreases plasma concentrations of non-alpha-tocopherols.
Tocotrienols differed from tocopherols in their effects on lateral and rotational mobility of the microsomal membrane components, and inhibited the activity of membrane-bound P450 enzymes, possibly through inhibition of interaction of components of the cytochrome P450 multi-enzyme complex. These effects may play a role in the cytotoxic nature of the tocotrienols and highlight the importance of the tocopherol-omega-oxidation pathway in minimizing their concentration in biomembranes.National Institutes of Health Training Grant DK07158-25

title: Modeling Infrared and Combination Infrared-Microwave Heating of Foods in an Oven
abstract: Fifth Chapter “Combined Microwave and Infared Heating of Foods” is a collaboration chapter written with Srikanth Geedipalli.A quantitative, model-based understanding of heat exchange in infrared

and combined infrared-microwave heating of food inside an oven is developed. The research is divided into three parts: measurement of optical properties, radiative heat transfer analysis and combined microwave-radiative heat transfer analysis. Optical properties of reflectance, absorptance and transmittance in a potato tissue are measured as a function of wavelength, using a spectroradiometer. Penetration of energy is higher for halogen lamps that emit in the near- and mid-infrared range, compared to ceramic rods that emit mostly in the far infrared range. Reflectance in the near infrared range increases with moisture content of the food, thus decreasing the energy coupled. Surface structure has significant influence on the optical properties. A 3-D radiative heat exchange model of an oven-food system is developed using a commercial finite-element package. The air in the oven is assumed transparent to the radiation. Heat conduction is assumed in the entire oven (food and air) for the short duration. The wavelength dependence of emissivity (non-gray surface) is found to significantly affect the surface radiative flux and the use of a non-gray model is recommended for such materials, although simplification of the emissivity variation is required to keep the computation time reasonable. Lowering food surface emissivity reduces the radiative flux that is absorbed by the food surface. Reducing oven wall emissivities increase the radiative flux on the food surface. The location of the radiative heat source in the oven as well as placement of the food relative to the heat source were found to have significant influence on the radiative heat flux over the food surface. To add microwave heating, Maxwell's equations of electromagnetics were solved for the same cavity using separate finite element software and the volumetric heat generation, in the food, obtained from this model was input to the radiative heat transfer model, thus coupling them. Using measures such as mean temperature rise and the standard deviation of temperatures, it was demonstrated that combination heating leads to more uniform heating, without compromising the speed of heating.

title: Structural Studies of Protein-Small Molecule Interactions: Bombyx Mori Pheromone Binding Protein Specificity for Bombykol, and the Substrate Specificity of Pantocin A Biosynthetic Proteins
abstract: Jon Clardy, Steve Ealick, Jerrold Meinwald, Brian CraneInteractions between small molecules and proteins mediate the biological processes of life. A knowledge of how proteins specifically interact with small molecules provides us with the tools to probe complex biology, but also allows us to develop potent and specific drugs to manipulate these processes to prevent, manage and cure disease.
In the first part of this thesis, the interactions between non-pheromone small molecules and the pheromone binding protein from Bombyx mori were explored by using X-ray crystallography to solve structures of these complexes. Pheromone signal transduction in moths provides a relatively simple model of the complex biology of neurological processing.
The second part of this thesis aimed to discover the functional form of a peptide substrate that interacts with biosynthetic enzymes to make pantocin A. This antibiotic is effective against Erwinia amylovora, the pathogen that causes fire blight disease. The functional form of the substrate was explored through genetic manipulation of the biosynthetic pathway that produces pantocin A.NIH

title: Albuterol Uptake in Bronchioles
abstract: Millions of people around the world suffer from asthma, which is characterized by breathing problems due to constricting bronchioles. While current remedies involve an effective inhaler drug, such as

Albuterol, that relieves such symptoms, it still has not been determined exactly how often such a drug should be administered. This project uses GAMBIT and FIDAP to model the uptake of Albuterol in bronchioles in order to determine how often these inhalers should be used to maximize drug delivery and quickly minimize symptoms. A suitable model of drug flow through the bronchioles was developed and we were able to determine how much Albuterol was present in the bronchioles at any given time. It was determined that the concentration reaches steady state at about 0.004 seconds, and concentration at every point was directly proportional to the defined inlet concentration after that. However, since we were not able to find the therapeutic concentration, or the minimum amount of Albuterol needed to be effective in relieving symptoms, we could not quite figure out the proper time spacing between inhaled dosages.

title: Bald is Beautiful, but is it Warm?
abstract: The head is a major source of heat loss (60-80%), and therefore, if conditions are cold enough, not keeping the head properly insulated could lead to hypothermia. Because of this, we were interested in determining to what extent hair aided in insulating the head. Are bald people at an extreme disadvantage in winter weather even if they wear a hat? Using Gambit to create a mesh of the head and Fidap to run simulations on that mesh, we were able to model the heat loss through the head for a twelve-minute walk. Because we are concerned with our own well being as well as the well being of our fellow students, we modeled our scenario as if a person were walking from Carpenter Library to Riley Robb Hall in cold temperatures. In our analysis, we focused on the temperature at the surface of the skin to compare all of our results. We found that all individuals wearing a hat (regardless of their hair thickness or lack thereof) are at an equal position in cold weather (skin temperatures varied by only 0.08°C). However, without a hat, the thickness of hair causes the skin temperature to change drastically. Small amounts of hair (up to one cm) have very little effect on the overall temperature of the skin after twelve minutes in cold temperatures, but once hair reaches a thickness of two cm, the head becomes significantly insulated and skin temperatures are much higher.

title: The Mysteries of Firewalking Revealed
abstract: The act of firewalking was once thought of as a supernatural experience, shrouded in mystery and revered as a feat of courage and determination. Through the use of computer aided engineering and basic thermodynamics, firewalking can now be explained scientifically. We created a mesh in GAMBIT that included a representation of a human foot, a steam layer and the hot coals. The steam layer was created by the Leidenfrost effect, which we were testing the validity of. We determined, using FIDAP, that the combined effect of the steam layer?s poor conduction and the favorable thermal properties of both the foot and coal make it is possible for anyone to walk along a hot coal bed. After taking away the steam layer, we discovered that the steam layer played a vital role in protecting the foot. If it is not present, the foot will be burnt, as the temperature of the foot at the location of the nerve ending will surpass the pain threshold temperature of 318 Kelvin.

title: Development of Frostbite in the Fingers
abstract: Physiologically, frostbite can only occur after a segment of tissue has been exposed to the elements for sufficient time such that the tissue temperature remains constant at 0 ?C and the solutions inside the tissue itself begin to form ice crystals and freeze. We will be exploring the time necessary for the development of each of the four degrees of frostbite as a function of the weather conditions , which will be represented by a reference temperature and a heat transfer coefficient (hc) based on the wind velocity. Additionally, we will also give consideration to two different insulation scenarios (bare finger versus gloved fingered) in order to determine the optimal type of insulation for different weather conditions. Our results, in the format of individual contour plots for selected temperatures and each of the insulation scenarios will provide insight into the relative danger of frostbite development and determine exactly what portions of the finger are most at risk.

title: Laser Hair Removal
abstract: Laser hair removal, through a process known as selective photothermolysis, is a new trendy way to remove all that unwanted hair. Traditional methods such as waxing, tweezing, shaving and electrolysis each have their disadvantages. However, selective photothermolysis provides a simple and relatively painless way to achieve that hair free physique. From our knowledge of the procedure, we found that the most ideal way to model the hair follicle would be in an axis-symmetric model that divides the follicle and its surrounding tissue in half. The follicle was modeled at a depth of .0035m. Other parts of the hair are neglected as we concluded them to be insignificant. After calculating the laser?s power and inputting it as a flux over the surface of the follicle, we found very pleasing results that agree with our target values. These values include a threshold of 60 degrees C for the follicle in order to completely damage it and a threshold of 50 degrees C for the skin that would cause a mild pinching sensation because of the minute sizes we are dealing with. To obtain optimal results the following three laser parameters were varied: fluency, pulse duration and thermal relaxation time. After rigorous testing we found the optimum values as follows: pulse duration of 10ms, thermal relaxation time of 40ms and finally a fluency of 50 J/cm^2. We also found through sensitivity analysis that the specific heat and conductivity do not vary with temperature within a certain range. However, density proved to be very significant and varied drastically with temperature change within the follicle.

title: Optimization of Nicotine Patch Placement
abstract: Nicotine patches are currently used as a transdermal drug delivery method help to people trying to quit smoking. Currently, those trying to quit smoking are encouraged to place the nicotine patch on the outside of the upper arm. This study examined the effect of placing the nicotine patch in different locations on the body. This was accomplished by examining a cylindrical section of skin (epidermal and dermal layers) with a nicotine patch placed on top. Epidermal layers were varied depending on the location of the patch: abdomen, back, ear and buttocks. The results showed that the placement of the patch on the body is relevant and that the epidermal layer of the skin is the biggest barrier to transdermal drug delivery. For faster delivery directly to blood it is useful to use an area of the body with a thin epidermal layer, but for a more time consistent delivery to the blood, a thicker epidermal layer is preferable. http://instruct1.cit.cornell.edu/

title: Radiofrequency Ablation for Treatment of Osteoid Osteoma Tumors
abstract: This project analyzes the different parameters involved in the use of radiofrequency ablation in destruction of osteoid osteoma tumors. Osteoid osteomas occur most frequently in the long tubular bones, especially those in the lower extremities. Studies in destruction of these types of tumors are critical because they occur most commonly in people that are in the prime of their life, between the ages of seven and twenty-five. Previous treatments such as surgical tumor removal are painful, costly, and require longer healing times. Radiofrequency ablation promises to destroy the cancerous cells with minimal invasion and loss of healthy tissue at a lower cost and shorter recovery time. Using finite element analysis, we determined the optimal probe placement and size, heating voltage, and duration of treatment. To find these parameters our group utilized FIDAP and GAMBIT to model and simulate physiological conditions during the ablation. We used the energy equation to govern our system simulation and neglected the convective heat transfer because heat loss due to blood flow was negligible compared with that generated by the probe. The electric field generated was modeled as a species concentration by the Laplace equation. This field was the determining factor in heat generation and therefore tumor destruction. Our model was three-dimensional and the radius of the bone was determined so that we could assume a semi-infinite region, in which the outer boundary was held constant at body temperature. Our initial conditions assumed that the tissue was at average body temperature (37 degrees). Our findings suggest that having a two-probe system, each probe with a radius of .0001m, held at 11 mV for 60 seconds is the most efficient, less invasive method. Our study also indicated that the number of probes used was insignificant and that the specific heat, the tissue density, electrical conductivity, and thermal conductivity were of less importance to this process.

title: Thermal Capsulorraphy for the Treatment of Acute or Chronic Shoulder Instability
abstract: Shoulder instability resulting from over-used and/or damaged ligaments is a frequent problem for physically active individuals, especially professional athletes. This chronic ailment had been traditionally treated with open procedures in the past, but arthroscopic alternatives have become the new wave in orthopedic treatment. Thermal capsulorraphy utilizes a Radio Frequency (RF) probe that is inserted in the shoulder to shrink the ligaments by denaturing the fibers and letting them stiffen during the subsequent renaturation process, thereby curing the instability. Our goal in this project is to model the heating of the shoulder ligament to determine the optimal time, convective heat transfer coefficient (h), and the proper heat generation (Q) to generate the most uniform results, while limiting the unwanted heat that is delivered to the surrounding tissue. We concluded that computer simulation can be used to better understand the heat transfer in the shoulder during thermal capsulorraphy. We also found that the optimal Q was 60,000 kW/m3 , the optimal h was 50 W/m2-K, the optimal time was 600 seconds per ligament strip, and the optimal number of probe sweeps was three to get the most effective results.

title: The Effects of Topical Heating for Therapeutic Uses
abstract: The application of topical heat for therapeutic purposes has become commonplace in America. It is used by professionals including physical therapists and physicians to treat their patients as well as by individuals within their home or at work. Using computer simulation of two-dimensional heat transfer through the outer tissue layers of the body, the process of heat transfer and temperature gradients within the tissues can be predicted. The objective of this study was to determine the temperature gradient of the muscle layer after applications of heat for less than one-half hour. Finite energy heat sources such as a hot water bottle as well as electric heat constant-temperature sources were evaluated. Applied temperatures were maintained at 50 C or less so not to irritate the skin surface. It was determined in all cases that the temperature of the muscle did not significantly increase within our time frame and actually began to cool after fifteen minutes with the hot water bottle case studies. On the other hand, the temperature of the epidermal-dermal layer, where nerve endings exist, remained at an elevated state of above 40 C for an extended period of time. It is inferred that a heat stimulated response of the neurons may be the cause of muscle relaxation and pain relief when a topical heat source is applied.

title: Will You Warm My Hand?
abstract: The objective of this design was to determine the effect of a commercial heating patch in a gloved hand on a cold day. Using Gambit and FIDAP, we meshed a gloved hand with results showing that this patch indeed warms the hand to normal body temperature in about 13 minutes. We also showed that varying blood perfusion rates do change the final temperature significantly. We also performed a sensitivity analysis with different types of leather gloves, but this only showed a change in temperature of about two degrees.

title: Cryogenic Treatment of the Common Wart
abstract: This study models the effect of applying subzero temperature liquids to the surface of a common wart. The goal was to determine which variables (i.e. conductivity of skin, temperature of liquid, duration of application) that affected the extent of wart death versus healthy skin damage and to maximize this ratio. The wart was analyzed as an axi-symmetric, isotropic solid that protrudes from the skin surface. GAMBIT was used to create the mesh of skin and wart, and FIDAP was used to conduct finite element analysis to model the freezing process. Our results showed that liquid nitrogen was the most effective agent for cryogenic treatment of warts. The application time that resulted in maximal wart death and minimal skin damage was nine seconds with liquid nitrogen. In addition, sensitivity analyses were performed to determine the impact of changes in parameters and properties. The bioheat term and changes in the heat transfer coefficient did not significantly affect the results. However, a thermal conductivity that varied with temperature produced significantly different results compared to a constant conductivity.

title: Public engagement with health research: Development of knowledge and attitude scales
abstract: This dissertation reports on the development of two measures useful to help understand how health research does - and does not - get used by the public. This project is important for several reasons. First, most major advances in health since the beginning of the 20th century are due to the application of new knowledge and technologies such as immunizations and preventive medicine. Also, there is an ongoing shift in the burden of disease away from infectious diseases and toward chronic diseases requiring increased patient self-management as well as behavior and lifestyle changes. Finally, a continuing emergence of self-care protocols as basic treatment practices combined with cutbacks in health services compound the need for a public that is fully engaged with the products of health research.
This work is conducted within a theoretical framework that posits health literacy as a primary tool individuals use to engage with the products of scientific research on health. Building upon that theoretical framework, this dissertation reports on the development of a method to assess the level of knowledge based on scientific research on health, or health research, that a person holds. Second, as attitudes are also important in terms of changing behavior to improve health, a measure to assess attitudes toward health research is developed. Both measures were tested in China, Mexico, Ghana, and India as part of a larger research effort conducted by the World Health Organization and local partners.
This work has developed two measures that will provide new information about public engagement with health research and health literacy. In addition to the central methodological developments, key lessons from this research are related to the role of health literacy in relation to the process of public engagement with health research, the design of international research projects, and the role of strict methodological guidelines to ensure validity and reliability. When applied, that knowledge can enhance efforts to promote public engagement with health research and, over the long-term, improve public health.

title: TOR Signaling and Arabidopsis Development
abstract: TOR (target of rapamycin) proteins are central regulators of cell growth in eukaryotes. Acting as protein kinases, they integrate nutrient, amino acid and hormonal signals to regulate ribosomal activity, mRNA recruitment to the ribosome and other processes via the phosphorylation of downstream activators. Their ability to phosphorylate target substrates depends on the activity of a second conserved eukaryotic protein, Raptor (regulatory associated protein of TOR), which as a TOR binding partner presents substrates to TOR for phosphorylation.
Mei2 is a putative TOR substrate in the fission yeast Schizosaccharomyces pombe. It acts in concert with a noncoding, mRNA-like molecule meiRNA to trigger meiosis in conjugated diploids under low nutrient conditions. Mei2 is present as a single-copy locus in a variety of eukaryotes and as a small conserved gene family in land plants.
This thesis describes efforts to characterize the Arabidopsis Raptor and Mei2 homologues as a means of understanding TOR signaling in land plants. Using a reverse-genetics approach, I have isolated Arabidopsis lines harboring disruptions of the Raptor homologues AtRaptor1A and AtRaptor1B, and crossed these lines to generate AtRaptor double mutants. AtRaptor1B mutants show subtle defects to root and shoot development; AtRaptor double-mutants show normal embryonic development but arrest growth as seedlings with minimal post-embryonic meristem-based growth.
AtRaptor1B interacts with the Arabidopsis Mei2 homologue AML1 (Arabidopsis Mei2-like 1) in a yeast two-hybrid assay, in an interaction mediated by the AML1 N-terminus. This implicates AML1 as a substrate for AtTOR in Arabidopsis TOR signaling. Using reverse-genetics complemented by a phylogenetic analysis of the AML gene family in Arabidopsis and elsewhere in the angiosperms, I show that there are two conserved

clades of AML-like gene products in the angiosperms. There is considerable redundancy among and between members of these clades. Single and higher-order mutants harboring disruptions of the AML loci yielded subtle defects in the timing of the transition to flowering. A line homozygous for disruptions in all five AML loci did not differ dramatically from lower-order insertion allele homozygotes; this may be due to accumulation of transcript fragments expressed from the disrupted AML5 locus.Dr. Maureen Hanson

title: Impossible Difference: "Writing" and the Question of Community in Modern and Postcolonial Literature
abstract: This dissertation contests indiscriminate valorization of "difference" and its cognates in postcolonial discourse by shifting attention to the ontological "impossibility of difference" of postcoloniality and to the ethical demand born of such an ontological consideration. The study begins with an analysis of Charles Baudelaire's treatment of the ethos of sameness in his lesbian poems. My argument is that at a time when the conceptualization of difference is assuming formative importance in modernity's political philosophy, cultural imaginary, and epistemology, Baudelaire's work is already undermining the Self-Other demarcation. The reason for my extending the scope retroactively to European modernity is that Baudelaire's time, as I view it, marks a historical juncture where the Self-Other dynamic begins to materialize a certain episteme by assuming a material "content."
Then, spanning the work of writers from a wide range of areas including Salman Rushdie (Indian British), Theresa Hak Kyung Cha (Korean American), and Dancing Crane (Taiwanese), this study examines, in particular, the way in which these writers approach the impossibility of difference by problematizing the concept and praxis of writing. That is, writing assumes a quasi-ontological status and functions as the site where the postcolonial subject materializes his/her conception of "community." The governing argument of the study is that the singular reliance on the singularized Self-Other model in the construction of postcolonial theory risks neglecting the relationship between the self and the collective, which too constitutes a crucial portion of the subject's ethico-political experience. Secondly, since the Self-Other model is conventionally premised on a power relation, sanctification of this model as the prominent language in postcolonial theory risks losing sight of postcolonial theory's own limitations, especially the confinement of political idioms. I argue that to consider postcoloniality in light of "community" is to configure postcoloniality not merely as a historical juncture but as a futurist episteme anticipating an emancipatory agenda that can break out of the dilemma of the idiom of difference and difference-driven identity politics. Theorists discussed in this study include Walter Benjamin, Jacques Derrida, Jean-Luc Nancy, and Emmanuel Levinas.

title: Dynamics and Origin of the Irregular Satellites of the Giant Planets
abstract: Although analytical studies on the secular motion of the irregular satellites have been published recently, these theories have not yet been satisfactorily reconciled with the results of direct numerical integrations. These discrepancies occur because in secular theories the disturbing function is generally averaged over the Sun's orbital motion, whereas instead one should take into account some periodic terms, most notably the so-called ``evection'', which can be large for distant, slow-moving satellites. Here it is demonstrated that the evection and other terms from lunar theory can be incorporated into the more modern Kozai formalism, and that our synthetic approach produces much better agreement with results from symplectic integrations. Using this method, the locations of secular resonances are plotted in the orbital-element space inhabited by the irregular satellites. The present model is found to predict correctly those satellites that are resonant or near-resonant.
The octupole term in the disturbing function is also analyzed to determine the strengths of resonant-locking for satellites whose longitudes of pericenter are librating. By independently integrating these satellites' nominal orbits using a symplectic integrator, the strength of this resonance can be successfully obtained from simple analytical arguments.
To elucidate the capture of Jupiter's irregular moons, we reverse-evolve satellites from their present orbits to their original heliocentric paths in the presence of Jupiter's primordial circumplanetary disk. These orbital histories use a symplectic integrator that allows dissipation. The present satellites Himalia, Elara, Lysithea and Leda are assumed to be collisional fragments of a single parent. The simulations show that this prograde-cluster progenitor could be derived from objects with heliocentric orbits like those of the Hilda asteroid group. The capture is shown to be energetically possible using analytical approach. The spectroscopic characteristics of the prograde cluster members are compared with those of the Hildas, with the conclusion that the surface color of the prograde-cluster progenitor is consistent with an origin within the Hilda group.
The effects of radiation forces on small irregular satellites are also explored. Two new radiation effects, the orbital YORP and the gradient Yarkovsky effect are presented as possible perturbations on irregular satellites' orbits. It is found that the orbital evolution of irregular moons due to radiation effects is small, but that their rotation should be strongly dominated by YORP effect. Various spin orbit resonances are found to be likely for many small irregular satellites.
The distribution of irregular satellite clusters in the space of proper orbital elements appears to be non-random. The large majority of irregular-satellite groups cluster are found close to the secular resonances, with several objects having practically stationary pericenters. The name ``Main Sequence'' is proposed to describe this

grouping, and it is noted that none of the largest satellites (those with radii $R >$ 100 km) belong to this class. Finally, this dichotomy appears to imply that the smaller near-resonant satellites might have been captured differently than the largest irregulars.

title: The Cunning Lust. Aesthetic and Political Perspectives on Masochism.
abstract: While the works of Alphonse Donatien de Sade have widely impacted aesthetic and critical discussions in 20th century avant-garde art and critical theory, the supposed ?inventor? of masochism, Leopold von Sacher-Masoch, has been largely neglected by scholars and critics alike. Only in recent years and in a tardy response to Gilles Deleuze?s Pr?sentation de Masoch (1969) have Sacher-Masoch and the subject of masochism received some attention within the debates in both German and Cultural Studies, notably by Albrecht Koschorke. Leopold von Sacher-Masoch (1988), John Noyes. Mastery of Submission (1997), Michael Gratzke. Liebesschmerz und Textlust (2000).
Die verschlagene Lust expands the contexts in which Sacher-Masoch?s work has hitherto been treated to problems in philosophy (master slave dialectic), confessional writing (Rousseau, recent queer studies), history (Sacher-Masoch?s historical and political writings), art history (strategies of visual appropriation), and performance studies (Nietzsche, Cansinos Assens, performance art of the 1960?s). Examined under these cross-disciplinary perspectives masochism proofs to be both a political and an aesthetic strategy, circumventing the dialectical impasses of transgression (as in Sad(e)ism and the early avant-garde) by operating through disavowal, seduction, and experimental reconfigurations of the given. While in existing research, Sacher-Masoch?s work has been predominantly classified as a phenomenon particular to the late nineteenth century, I argue that we must consider its refusal of artistic authorship and destabilisation of the reality principle as prefiguring post-modern theory and aesthetics.
The literature discussed includes: Sacher-Masoch?s collections Das Verm?chtnis Kains, Vols. I and II (1877), Russische Hofgeschichten (19uu), his historical works Der Aufstand in Gent unter Kaiser Carl V. (1857), Ungarns Untergang und Maria von ?sterreich (1862), and among others the following: G.W.F. Hegel. Phenomenology, Jean Paul Sartre. Being and Nothingness, Jean-Jacques Rousseau. Confessions, Eve Kosofsky Sedgwick. A Poem is Being Written, Rafael Cansinos Assens. Est?tica y Erotismo de la Pena de Muerte, Herrmann Nitsch. orgien mysterien theatre, and Friedrich Nietzsche. Birth of Tragedy.

title: Echoes of Expression: Text, Performance, and History in Mozart's Viennese Chamber Music
abstract: This dissertation begins with a source-critical problem with consequences for performance: the many differences between autographs and disseminated sources of Mozart's Viennese instrumental music. This problem serves as a foil for two lines of inquiry: the notion of performance in the late-eighteenth century and the place of performance in historical scholarship. The first chapter traces the recent history of Mozart scholarship in the context of wider debates about writing history; here, the central methodological question of the dissertation -- is there a musical way to write music history? -- is raised for the first time. The second chapter compares traditional musicological techniques of textual editing with more recent developments in the fields of "performance studies" and considers their application to the "multi-textuality" of some of Mozart's Viennese instrumental music. In the third chapter, the growing interest in the expressive qualities of human language in German aesthetic thought beginning around 1770 serves as background to an examination of shifts in thinking about the place of expression in musical performance. String quartets by Mozart and his contemporaries are explored for evidence of this change, and for the clues they might offer to their composers' opinions about fixing musical expression in text. The fourth chapter appraises two performances of Mozart's Fantasy for Clavier in c Minor K. 475, one by the composer himself and one in Wilhelm Heinse's 1795 novel Hildegard von Hohenthal. If performance is a criteria for interpretation, it is argued, then these performances yield two different meanings for K. 475. In the fifth chapter an instance of 'multi-textuality' in the String Quintet K. 593 is studied in detail. K. 593's material sources (autograph manuscript, manuscript copies, and early engraved editions) are considered in relation to documents of an early performance involving Mozart. Read together, these "echoes" of the expressive acts of performance paint a complex picture. Finally, a short epilogue draws major themes of the dissertation together and suggests that the arrival of both new theories of linguistic expression and the birth of "historicism" around the time Mozart was active as a composer is no coincidence.

title: THE ELECTRONIC AND OPTICAL PROPERTIES OF COLLOIDAL LEAD-SELENIDE SEMICONDUCTOR NANOCRYSTALS
abstract: Quantum dots of the IV-VI semiconductors, and specifically lead selenide, strongly confine both electrons and holes, leading to a dramatic modification of the bulk semiconductor properties. This dissertation is devoted to the study of the electronic and optical properties of colloidal lead-selenide nanocrystals or quantum dots. We begin by discussing the synthesis and characterization of high-quality colloidal lead-

selenide nanocrystals with a narrow size distribution and well-passivated surfaces. With diameters between 3 and 8 nanometers, these lead-selenide quantum dots exhibit size-quantized transitions in the infrared region of the electromagnetic spectrum and exhibit bright band-edge photoluminescence tunable from approximately 1000 to 2000 nanometers. These properties are extremely promising for applications. The current theoretical understanding of the electronic states of IV-VI semiconductor quantum dots is based on envelope function approaches and tight-binding methods. While successful in explaining many features of the electronic structure, all current calculations fail to explain the presence of additional peaks in the optical absorption spectrum of lead-selenide and lead-sulfide quantum dots. We re-examine the leading explanations for these unexplained transitions and also consider a new possibility, that of enhanced electric quadrupole transitions. In addition, the degeneracy of the lowest optical transition in IV-VI quantum dots is predicted to split by the intervalley coupling of the 4 equivalent L-valleys in the first Brillouin zone. Low-temperature photoluminescence and size-selective photoluminescence experiments reveal, for the first time, a splitting in the emission spectra of lead-selenide and lead-sulfide nanocrystals. These observations are consistent with a theoretical treatment of the splitting of the lowest transition in lead-selenide quantum dots due to intervalley coupling.The dynamics of electrons and holes are crucially influenced by quantum confinement. In the strong confinement limit, a dramatic reduction in the excited state (or intraband) relaxation rate of carriers is predicted to occur. With its sparse electronic states and simple energy spectra, lead-selenide quantum dots represent an ideal material system in which to study the intraband carrier relaxation. We present the first measurements to directly time-resolve the intraband relaxation of electrons and holes in lead-selenide nanocrystals. Prior theories cannot explain the observed picosecond time-scale intraband relaxation and we discuss several possible explanations.This work is primarily supported by the Center for Nanoscale Systems at Cornell University, under the Nanoscale Science and Engineering Initiative of the National Science Foundation: NSF Award # EEC-0117770

title: AN EXPERIMENTAL AND ANALYTICAL INVESTIGATION OF WAVE INTERACTION WITH AN OFFSHORE SUBMERGED CYLINDRICAL STRUCTURE
abstract: The interaction of periodic waves with a model offshore submerged water intake structure was examined experimentally and analytically. Two wave conditions, with long and short wavelengths relative to the structure?s characteristic length scale were tested. Flow kinematics were characterized using particle image velocimetry and the wave motion measured with capacitance wave gages. Pressure distributions at key locations around the model as well as inline and uplift forces were measured with an array of pressure sensors distributed around the model. The two types of waves tested simulated the maximum and minimum typical conditions estimated to be present on existing intake structures. Additionally, flow visualization was carried out for a solitary wave traveling over the structure to better characterize the processes that occur in the vicinity of the structure. A complete description of the flow kinematics is presented for the long wave case. The main vortex patterns are related to the wave motion induced inline and uplift forces. Large scale vorticity patterns generated on the weather and lee sides of the structure influence the loading of the structure, primarily the uplift force where large uplift coefficients were found. The dominant vorticity pattern, a vortex filament pair, was linked to the maximum uplift coefficient. The inline force coefficient found is similar to coefficients previously reported for cylindrical structures. The ratios of total vs two component turbulent kinetic energy were estimated. Results disagree with typical ratios found in other studies and generally used to estimate total kinetic energy when one component of velocity is missing. However, large turbulent kinetic energy uncertainty levels were found and caution is advised when using this information. An analytical model based on small amplitude wave theory and irrotational flow solved using a eigenfunction expansion

method is presented. Results are compared with experimental values measured for a short wavelength case, conducted specifically to verify and validate the model. Horizontal and vertical velocities as well as inline and uplift force coefficients are in good agreement. Force coefficients were also compared with the long wavelength case results and similar maximum values were obtained. The model is capable of estimating wave scattering, flow kinematics, and wave induced loading on the structure in the diffraction range.

title: Cost Sharing and Approximation
abstract: Central to this thesis are problems in which a group of users can benefit from building and jointly using some kind of infrastructure, be it a set of supply depots, service stations, or a communication or transportation network. We study two important questions related to these kinds of scenarios: (1) how to build the shared facility that satisfies the needs of a given set of users in a cost-effective way, and (2) how to split the cost of the shared facility among the participating users in a fair and reasonable way.

In the first part of the thesis, we seek to design cost sharing functions with desirable game-theoretic properties. We are looking for cost sharing functions that are fair, and encourage cooperation among users. This is captured in the notion of cross-monotonicity: it says that a cost share of any user should never increase as more people join the system, and never decrease when players leave. Towards this end, we develop a new technique to generate such cross-monotonic cost shares using a primal-dual type process, and use it to design cross-monotonic cost shares for several NP-hard optimization problems.

In the second part we proceed in a slightly different direction, applying cost sharing to the design of approximation algorithms. We consider a class of two-stage stochastic problems with recourse. In these problems, we can buy building blocks (edges, facilities, vertices..) in two stages. In the first stage, the elements are relatively inexpensive, but we do not know the requirements of users we will have to serve (we only have a probabilistic forecast of their demands). In the second stage, the actual demands are revealed, and we must buy enough elements (now at a higher price) to satisfy all user demands.

We show that whenever the underlying deterministic problem admits a certain type of cost sharing, an extremely simple strategy gives us good approximation guarantees: in the first stage, take several samples from the forecasted distribution, and build a solution that covers all the sampled clients at the low price. When the real users materialize, augment the first stage solution to cover the actual demands. In this way we obtain constant approximation algorithms for stochastic versions of problems like Uncapacitated Facility Location, Steiner tree, Steiner Forest or Vertex Cover.

title: Quantitative two-photon redox fluorescence microscopy of neurometabolic dynamics
abstract: The fluorescence of the intracellular electron donor reduced nicotinamide adenine dinucleotide (NADH) is a well established probe of cellular metabolic state. This technique, called redox fluorimetry, can be combined with two-photon microscopy to provide functional imaging deep in living neural tissue with a spatio-temporal resolution far exceeding that of conventional functional imaging techniques (e.g. fMRI, PET). This resolution offers a new opportunity to explore spatio-temporal heterogeneities in the response of neural tissue to stressors such as metabolic inhibition and activity induced metabolic load. These metabolic responses were found to differ between cell types in the brain (astrocytes and neurons) and between sub-cellular compartments (mitochondria and cytosol). The time course of compartmental responses revealed that

transient hypoxia caused an NADH increase followed by a post-hypoxic mitochondrial NADH hyperoxidation and a cytosolic lactate accumulation. A similar analysis of the time course of electrical activity induced metabolic responses revealed that the metabolic cost of neural activity was first met by oxidative neuronal metabolism followed by glycolytic metabolism in astrocytes.

The accuracy of redox-fluorimetry is limited however, by the effect of the local environment on the fluorescence of intracellular NADH. To characterize the effect of the intracellular environment on the photophysical properties of intracellular NADH, we measure its time resolved fluorescence and rotational anisotropy decays. These decays characterize the excited state and rotational dynamics of intracellular NADH, and from them we can infer how metabolic inhibition affects the enzyme binding states of NADH and the local viscosity for NADH rotational motion. The net effect is a reduction of the average lifetime of intracellular NADH fluorescence upon metabolic inhibition, causing the fluorescence increase during inhibition to underestimate significantly the actual concentration increase.

Historically, measurements of the NADH response to metabolic perturbations have not significantly described the complexity of this response. The research presented here shows that metabolism associated changes of intracellular NADH are not only spatio-temporally heterogeneous, but also entail changes in the NADH conformation and its photophysical properties. By characterizing and accounting for these effects, we make progress towards quantitative redox-fluorimetry and the development of an accurate picture of in vivo NADH dynamics.NIH-NIBIB, Number 9 P41 EB001976-18, "Biotechnology Research Digital Electro-Optical Imaging."

title: Random Networks with Tunable Degree Distribution and Clustering
abstract: We present an algorithm for generating random networks with arbitrary degree distribution and clustering (frequency of triadic closure). We use this algorithm to generate networks with exponential, power law, and poisson degree distributions with variable levels of clustering. Such networks may be used as models of social networks and as a testable null hypothesis about network structure. Finally, we explore the effects of clustering on the point of the phase transition where a giant component forms in a random network, and on the size of the giant component. Some analysis of these effects is presented.NSF (IGERT-0333366)

title: SIMULATION OF THE INTERACTION BETWEEN PROTEINS AND A CHARGE-NANOPARTTERNED SURFACE
abstract: The characteristics of protein recognition and actuation on a silicon device are investigated using Dynamic Monte Carlo simulations with both a simple cubic lattice model and a high-resolution lattice model. The surface of a model device has a nanoscale electrostatic charge distribution produced by charged nanocrystals embedded into the model device. Thermodynamic and structural quantities of the protein-surface interaction are calculated using the Miyazawa-Jernigan contact energies for the simple cubic lattice model, and the Skolnick-Kolinski interaction scheme for the high-resolution lattice model. A parallel tempering method is applied in the simulation.

The results indicate that the B1 domain of Protein G (1gb1) and two mutants of 1gb1s with the same mass, isoelectric points, and amino acids can be separated on the surface based on binding affinity differences. The differences are caused by the different surface charge distributions of the proteins. A protein with a more

disperse charge distribution along the sequence has a lower affinity, while a protein with a more segregated charge distribution has a higher affinity. The segregated charge allows the protein to be denatured further by the generation of stronger Coulombic forces between the protein and the charged nanocrystals. This suggests that charge-patterned surfaces may be able to differentiate similar proteins that are usually difficult to separate by conventional methods.

It is also demonstrated by the simulation that proteins can be actuated by switching and moving the charges of the nanocrystals. This result suggests that if fast reprogrammability of charges is realized, the device could be used to actuate a single biomolecular in a controllable manner.

The simple cubic lattice model allows us to predict thermodynamic properties with ease, while the high-resolution lattice model enables us to estimate realistic protein structures. A combination of the two methods will be a useful tool to obtain thermodynamic, kinetic, and structural characteristics of protein adsorption on model devices.

title: Transnational Religion and Secular Institutions
abstract: TRANSNATIONAL RELIGION AND SECULAR INSTITUTIONS: STRUCUTURE AND STRATEGY IN HUMAN RIGHTS ADVOCACY
Evelyn Louise Bush, Ph.D.
Cornell University 2005
This dissertation examines the influence of international institutions on religious NGO claims making. An analysis of religious participation in Human Rights addresses three general questions. First, how has the rationalization of the human rights field influenced levels of religious mobilization in human rights? Second, how, and through what mechanisms, do religious NGO frames transform as a result of participation in secular international institutions? Third, how, and through what mechanisms, is access to human rights institutions associated with religious and regional characteristics of NGO? These questions are addressed through analyses of 24 key- informant interviews, United Nations documents and press releases pertaining to the UN Declaration of Commitment on HIV/AIDS, and an original dataset comprised of 591 religious human rights organizations.

First, religious NGO foundings over the past century show that religious movement into the public sphere increased while Human Rights was becoming a highly bureaucratized regime with international institutions at its core. Interviews with religious NGO members confirm that the increase in religious NGO foundings over the past fifty years does not indicate cooptation of religious NGOs for the pursuit of secular agendas. Rather, religion still serves as the primary motivating force behind human rights activism among religious NGOs.

Second, analyses of interviews and United Nations documents reveal two strategies ? discursive secularization and procedural rationalism ? that religious groups use to assert claims, to create alliances with other NGOs, and to minimize conflict in situations where religious and secular human rights norms conflict. Religious NGOs use these strategies to capitalize on advantages and mitigate disadvantages associated with religious affiliation in terms of alliance formation and competition for funding within Human Rights.

Third, binomial logistic regression reveals that NGO consultative status with international institutions systematically varies by religious affiliation and location of secretariat. This variation is explained by the intersection of two types of variables: those indicating conformity to hegemonic principles and those indicating organizational resource capacity. In spite of institutional differentiation, religion not only remains relevant in the public sphere, but also continues to be influenced by relationships with states at the transnational level of analysis.Research based on grants from National Science Foundation and Mario Einaudi Center for

title: Dependence Structures beyond copulas: A new model of a multivariate regular varying distribution based on a finite von Mises-Fisher mixture model
abstract: A multivariate regular varying distribution can be characterized by its marginals and a finite measure on the unit sphere. That measure is referred to as the spectral measure of the distribution. The spectral measure describes the structure of the dependence between the marginal distributions. An important class of multivariate regular varying distributions are multivariate extreme value distributions. Existing models for multivariate regular varying distributions in general and multivariate extreme value distributions in particular do not utilize the spectral measure. They focus on closed form equations of the cumulative distribution function. The resulting models are not flexible enough to give a realistic and adequate description of the dependence structure of real life data.

We propose a new model for multivariate regular varying distributions, based on a very flexible parametric model of the spectral measure. We use a finite mixture model to obtain a model with as much flexibility as needed to accurately describe the spectral measure of real life data.

Since the spectral measure is a measure on the unit sphere, we chose directional distributions as the distributions of the components of the mixture model. Directional distributions provide models for the distribution of random variables on unit spheres. In particular, we use the von Mises-Fisher distribution. Its properties allow it to be interpreted as an directional analogue of the well known normal distribution on a Euclidian space.

We describe how to estimate the parameters of this new model from datasets. We introduce a modified version of the likelihood ratio test to decide on how many components are needed for an accurate model of the spectral measure.

We show how our model explains the structure of the spectral measure of several financial time series. We develop a comprehensive model for a multivariate regular varying distribution that is based on our model of the spectral measure. As one particular application of this new model we describe how it can be used for portfolio optimization. We found that our model gives much more accurate results than two other well established models. It significantly improves on the deficiencies of the two existing models.

title: EFFECTS OF ENDORSER ATTRACTIVENESS ON AUDIENCE PERCEPTION OF ENDORSER CREDIBILITY IN CORPORATE SOCIAL RESPONSIBILITY MESSAGES
abstract: Much research has been conducted regarding the physical attractiveness of spokespersons as related to perceptions of credibility of the spokesperson and the sponsoring organization. Advertising and marketing research has shown that physical attractiveness can lead to greater perceptions of credibility of both the spokesperson and sponsoring organization, but these findings often depend on the type of products being marketed, e.g. everyday products versus beauty-enhancing products. This thesis is an experiment that tests whether a highly attractive or moderate/unattractive endorser leads to greater perceived credibility of corporations in the context of selling ideas, i.e. the concept and credibility of corporate social responsibility messages, rather than the selling of commercial products. The study also tested for interactions between attractiveness of endorser, company type, and personal involvement.
One hundred and thirty-seven subjects participated in a 2X2X2 experimental design study (in survey form) in which I manipulated the independent variables of endorser attractiveness and company type and measured cognitive involvement (control variable) and examined their effects on perceived credibility of the endorser and organization. Furthermore, this thesis examines the relationship between endorser credibility and organizational credibility.
Results from the data analysis suggest, first, that there is a positive correlation between endorser credibility and corporate credibility. Second, attractiveness does not behave the same in public relations as in product marketing and advertising. Specifically, this study's findings suggest that attractiveness was negatively correlated with perceptions of overall endorser credibility as well as endorser expertise and trustworthiness. Third, there is an interaction between company type and endorser attractiveness for perceptions of endorser expertise. Finally, the results show that high cognitive involvement does not lead to smaller differences of means in endorser credibility between attractive and unattractive endorsers as was hypothesized in this study.

title: Design of Integrated, Efficient Power Amplifiers for Next-Generation Wireless Communications
abstract: Kevin Kornegay, Alyssa Apsel, Lester EastmanAn integrated power amplifier and DC-DC converter are presented to create a variable supply voltage power amplifier to improve battery life in cellular handsets. This system has the ability to reduce the average battery current drawn by a handset power amplifier by

operating at lower supply voltages when not transmitting at maximum power. This type of system has not been adopted because of the need for additional circuitry when used with traditional power amplifier modules. To be attractive to system designers, advanced power amplifiers need to exhibit the integration that has been seen in modern radio receivers. In this work, SiGe BiCMOS technology is harnessed to achieve the integration of both circuits on one die, presenting a solution to the desire for high efficiency in a single chip solution.

The design of power amplifiers in SiGe technology is explored, with a focus on the design of a WCDMA handset power amplifier for third generation mobile systems. The design challenges of such a circuit are presented, along with a design methodology involving a mix of time and frequency domain simulation techniques. Layout concerns are addressed in regards to the SiGe BiCMOS process, and their impact on power amplifier performance is highlighted. Measured results are presented which meet the linearity requirements of WCDMA.

A high switching frequency DC-DC converter is also examined, with a focus on integration of such a circuit with a power amplifier. The impact of frequency selection and converter efficiency is analyzed, and several techniques to improve the efficiency are presented. Simulation and measurement results are presented which show excellent agreement over the broad range of converter operating conditions. An analysis method for determining the average reduction of battery current in a variable supply voltage system is presented, with results given for the DC-DC converter/power amplifier integrated system. The integration issues and system performance in regards to physical layout are discussed. The final system measurements show the successful performance of the power amplifier under variable supply voltage operation with the DC-DC converter. The results of this work demonstrate the feasibility of such an integrated, efficient power amplifier and provide a path for integration of advanced power amplifier systems with other transceiver components.

title: Claiming Territory
abstract: Masters ThesisIn this thesis, I examine the discursive construction of colonial state space in the context of British India's turn of the century North-West Frontier. My central argument is that notions of a uniform state space posited in official theorizations of the frontier need to be reexamined not as evidence of a particular kind of rule, but rather as a claim to having accomplished it. Drawing on new colonial historiographies that suggest ways of reading archives and archival documents for their silences and on historical sociological understandings of state-formation, I offer close readings of three different kinds of documents: writing about the North-West Frontier by members of the colonial administration, annual general reports of the Survey of India, and narratives written by colonial frontier officers detailing their time and experience of "making" the frontier. I begin by looking at the writings of George Nathanial Curzon and others attempting to theorize the concept of frontiers in turn of the century political discourse. Framed against the backdrop of the "Great Game" for empire with Russia and the progressive territorial consolidation of colonial frontiers into borders in the late 19th century, these arguments constitute what I call a "colonial theory of frontiers." This theory simultaneously naturalizes colonial space and presents borders as the inevitable result of colonial expansion. This theorization, I argue, is particularly important to reexamine as it operates on a set of assumptions that have been adopted into social science notions of territory. These assumptions take space as "given" and static as opposed to fluid, contingent, and contested.

I explore this late colonial theory of frontiers as "claims" to territorial rule by looking at the discourse of cartography in the context of the North-West Frontier. Cartography, like colonial frontier theory, posits a uniform state space where the boundaries of rule are neatly demarcated by borders. A closer examination of maps along the North-West Frontier, however, suggests that processes of territory making in this region

neither conform to simple notions of cartographic demarcation nor to colonial frontier theory more generally. Finally, I suggest that these spaces are better understood as zones of negotiation and state formation where claims of colonial territorial integrity are anything but certain. Such an understanding of territory displaces approaches that tacitly designate places as either state or non-state and demonstrates that claims to territorial control must always be understood in the context of the contingent, contested, and negotiated claims for making space into place.

title: An Evaluation of Demand Response in New York State's Wholesale Electricity Markets
abstract: Dr. Richard Boisvert, Dr. Timothy MountThis thesis identifies the conditions under which and quantifies how much society gains from integrating demand response directly into wholesale electricity markets and the level of participation that will bring about these improvements. Furthermore, it identifies the conditions under which the bulk power system is made more reliable through the participation of demand response and the inducements necessary to achieve this improvement. To accomplish these goals, an econometric representation of New York's wholesale electricity markets' supply curves is developed in order to understand exactly how changes in load affect price.

Economic demand response is very sensitive to locational differences in the bulk power system. The simulations undertaken illustrate how a significant amount of demand response is needed in Western NY to generate a positive change in net social welfare, under rather extreme conditions, whereas very little must be relied upon in New York City and Long Island, under much more reasonable circumstances. From a reliability standpoint, demand response can play a vital role in accurately maintaining reserve margins provided the payment or tariff rate is allowed to fluctuate given the quantity of reserves needed. When a fixed rate is instead used, the reliability benefits from load curtailments are almost always less than the costs to achieve them.

title: ESSAYS ON STRUCTURAL ANALYSIS OF RETAIL COMPETITION USING CLASSICAL AND BAYESIAN ESTIMATION TECHNIQUES
abstract: The thesis is a collection of three essays on retail competition that are relevant to both the theory and practice of marketing. Essay 1, examines the role of price and category assortment on competition between EDLP (Every Day Low Price) format and HILO (Promotion) format retail stores. Policy experiments are conducted to study the strategic implications of 1) retail assortment reduction and 2) customized (household specific) coupons. The empirical analysis is conducted using a) household and store level scanner data and b) combination of hierarchical Bayes and classical estimation techniques.
Essay 2, models the price and geographic location elements of consumer demand, firm costs and competition in the lodging industry. A new demand model (Heterogeneous Aggregate Generalized Nested Logit) is introduced. The essay demonstrates the role of geographic location as an important element of retailers? marketing mix. Essay 3, proposes an empirical framework for long-run discrete dynamic games to study market firm's entry, stay, and exit decisions in the lodging market. The econometric model is based on Markov perfect equilibrium concept and relies on dynamic programming computational techniques. Essays 2 and 3 use aggregate data and classical estimation techniques to recover the underlying structural parameters.

title: The Hunt in Romance and the Hunt as Romance
abstract: Winthrop Wetherbee, Andrew Galloway, Masha RaskolnikovThis dissertation examines the English and French late medieval hunting manuals, in particular Gaston Phebus' Livre de chasse and Edward of Norwich's Master of Game. It explores their relationships with various literary and nonliterary texts, as well as their roles in the late medieval imagination, aristocratic self-image, and social economy. The medieval aristocracy used hunting as a way to imitate the heroes of chivalric romance, whose main pastimes were courtly love, arms, and the chase. It argues that manuals were, despite appearances, works of popular and imagination-stimulating literature into which moral or practical instruction was incorporated, rather than purely didactic texts.
The first three chapters compare the manuals' content, style, authorial intent, and reader reception with those of the chivalric romances. Both genres are concerned with the interlaced adventures of superlative but generic characters. Furthermore, both genres are popular, insofar as they are written for profit and accessible to sophisticated and unsophisticated readers alike.
The following four chapters examine the relationships between hunting, love, and military practices and ethics, as well as those between their respective didactic literatures. Hunters, dogs, and animals occupied a sort of interspecific social hierarchy, and the more noble individuals were expected to adhere to a code of

behavior similar to the chivalric code. Military and amatory manuals, like hunting manuals, are texts that encourage imagination and role-playing and utilize the characters and narratives of chivalric romance. The hunting manual is a kind of arms manual that explains how to make war against animals; but it is also a sort of anti-love manual that teaches the hunter how to avoid feminine wiles.

The final chapter documents a wide-ranging literary motif ("the generic literary hunt") that informs the structure and content of a large number of medieval works, from the most primitive hunting manuals to Sir Gawain and the Green Knight.

The concluding chapter explores the evolution and popularity of the English printed hunting manuals from the fifteenth through the seventeenth centuries. The new manuals appealed to the social aspirations of an up-and-coming urban bourgeoisie, even as the European forests and their animals were disappearing.

title: Termite: A Swarm Intelligent Routing Algorithm For Mobile Wireless Ad-Hoc Networks
abstract: A biologically inspired algorithm is presented to route messages in mobile wireless ad-hoc networks. Such computer networks are primarily characterized by their quickly changing topologies due to frequent node mobility. The principles of swarm intelligence are used to define a probabilistic algorithm for which routing through paths of maximum utility is an emergent property. This adaptive algorithm, dubbed \ emph{Termite}, uses stigmergy to reduce the amount of control traffic needed to maintain performance. Strong routing robustness is achieved through the use of multiple paths; each packet is routed randomly and independently. Once the basic operation of Termite is verified, alternative metric estimation techniques are tested via simulation. Optimal system parameters are selected by testing over orders of magnitude. A simple analytical model is built in order to explain the simulation results. The model also used to propose two heuristics for determining the optimal pheromone decay rate. All of the enhancements to Termite, now known as \emph{ReTermite}, are consolidated and tested against Ad-hoc On-demand Distance Vector (AODV), a leading ad-hoc routing algorithm. ReTermite is shown to be superior in many primary metrics and the reasons for this explained. Previous heuristic models are also compared to simulation results.The work presented in this thesis was made possible with the generous support of DARPA ITO under the project name, "Self-Configuring Wireless Sensor Networks," and of NSF - CRCD, Microsoft, and Hewlett Packard under the project title, "The Ad Hoc Classroom: Integrating Emerging Wireless Communications and Networking Technologies into Mainstream Computer Science and Electrical Engineering Curricula."

title: Integrating Societal Culture and Corporate Culture through Workplace Design
abstract: This study examines the connections between societal culture, corporate culture, and workplace design, highlighting the importance of employees' societal culture to the effectiveness of design within multinational corporations (MNCs). Models of culture, behavioral theories, and research on workplace design are reviewed to explore their inter-relations. An exploratory case study using the narrative method, describing the design process of a new office facility for the Latin American division of Discovery Networks International, is presented to illustrate the salient points discussed. Findings from this study support related research conducted by such as Lincoln, Hanada, and Olson (1981); England (1983); Erez and Earley (1993); and Mendenhall, Punnell, and Ricks (1995) that the consideration of contextual societal culture is relevant in managing human resources and promoting employee satisfaction and efficiency. The considered case

illuminates certain conflicts that arose when traditional corporate-culture-influenced design clashed with the societal culture of the new office's denizens. These conflicts manifested in areas involving (a) private space, (b) worker autonomy, (c) personal expression, and (d) hierarchical reinforcement. The narrative also illustrates how resolution of the issues was possible through an integrated approach that took into account aspects of both societal culture and corporate culture in the design.

title: The Successful Preservation of Rock and Roll Music Sites: Paul McCartney's Childhood Home in Liverpool, England and the Chess Records Office and Studio in Chicago, Illinois
abstract: Michael Tomlan, Associate Professor & Director, Historic Preservation Planning Program; Mary Norman Woods, Associate Professor, History of ArchitectureGroundbreaking preservation efforts for two highly significant rock and roll music sites are examined: Paul McCartney's childhood home in Liverpool, England, under the protection of the National Trust, and the former Chess Records office and studio in Chicago, Illinois, landmarked under city ordinance.

Mid to late twentieth-century popular music sites face multiple threats of demolition, neglect, and inappropriate treatment. The lack of architectural distinction, bias against relatively recent history, and need to establish the relevance of popular culture inhibit successful preservation of rock and roll sites. Yet popular interest in such sites has exploded since the 1990s and visitation is on the rise. Increasing interest in these locations translates into more opportunities for funding and support. At the same time, it intensifies the need for preservation as popularity attracts exploitation schemes that threaten the integrity of the sites. Finally, given the difficulty of finding accurate documentation of these sites, the critical time to work on their preservation is while people who know their history firsthand are still alive.

The examination includes a review of the literature, much of it in popular media, and primary research in the form of site visitation; interviews with key people and related experts; collection of original documentation; and some observation of work in progress.

Research establishes the historic context, significance, and local preservation climate for each site. The preservation projects' processes and outcomes are documented and critiqued. Findings suggest that there are five major components necessary for successful preservation of rock and roll music sites: preservation protection through institutional purpose or legal status; funding; long-term preservation philosophy; regular observation of work and adherence to a restoration design plan; and research. Noting that these are widely applicable components, three non-critical factors are distinguished which have special significance for this subset of historic sites: the need for significance to counter biases; public value and visitation; and support of name stars.Cornell University Institute of European Studies; Cornell University Department of City and Regional Planning

title: Optical Micro-Electro-Mechanical Systems for Add/Drop Multiplexing and Infrared Spectroscopy
abstract: Wide ranging efforts in development of various Micro-Electro-Mechanical (MEM) devices over the past twenty years have created a vast collection of novel devices that can be fabricated in numerous ways. As the MEMS field matures it is important to remember the systems aspect the name implies and ensure useful and complete systems are constructed utilizing these wonderful devices. This thesis focuses on two different areas of application for optical MEM systems.

The first is a system for optical telecommunications networks that enables an optical add/drop multiplexer, also frequently called a wavelength selective switch. Wavelength selective switches anticipate the need for inexpensive optical switching components with the extension of the optical domain of telecommunications to the end user through fiber to the home. The wavelength selective switch studied is based on the hybridization of a MEMS based optical switch with a particular type of planar lightwave circuit, or on-chip waveguiding device, called an Arrayed Waveguide Grating (AWG). Three separate MEMS switches were implemented into this type of system: a lateral fiber actuator, a scanning micro-mirror, and a binary micro-mirror array. The binary micro-mirror array displayed the greatest performance and is additionally advantageous because of the possibility of further integration. This implementation of a wavelength selective switch provides excellent optical networking properties and performance at low power and with a small device area compared to other switch implementations. Additionally, the system is scalable as the network increases in port count and channel density.
The second system studied is an optical gas spectrometer. A scanning MEMS mirror was used with various additional optical components to create a Non- Dispersive Infra-Red (NDIR) gas detector. The MEMS mirror is used in conjunction with a Linear Variable Filter (LVF) to scan a particular range of IR radiation. By detecting the transmission spectrum within the IR radiation band, detection of gases based on their unique radiation absorption pattern can be carried out. Detection of CO2 in concentration ranges from 400ppm to a few percent was performed. Simultaneous detection of multiple species is possible. The system offers a potentially portable and inexpensive gas spectrometer with accuracy necessary for various commercial needs.

title: Normal vs. Abnormal Pharyngeal Bolus Transport
abstract: Paper is in HTML on a secure site.Normal and abnormal swallowing (dysphagia) processes in the pharynx were modeled using the computer-aided engineering software, FIDAP. In the normal case, boundary conditions for the epiglottis were established to prevent fluid flow into the larynx/trachea area. In the abnormal case, the boundary conditions for epiglottis were changed to allow some flow into the larynx/trachea. The program converged successfully when the mesh was simplified, and two distinct flow patterns were observed for both normal and abnormal cases. Sensitivity analysis of abnormal swallowing behavior showed that the flow present in the trachea was slower at higher viscosities. This suggests that the method of feeding dysphagia patients with thickened liquids is useful in preventing aspiration.

title: Comparison of Vaccine Freezing Methods
abstract: We have developed a temperature-sensitive vaccine formulation in a glass vial that needs to be frozen prior to lyophilization.The method for freezing the vial has traditionally been liquid nitrogen tunnel freezing, but this method can be expensive and has problems with sterilization of the tunnel.We explored the advantages of a shelf-freezing method and did a comparison analysis on the two freezing methods to determine which situation was the preferred one.For our analysis, the vaccine vial dimensions were obtained from research performed by Merck & Co., Inc.We predicted that the shelf-freezing method would take too long to freeze the vaccine, which in turn would decrease the potency of the vaccine.We simulated both freezing methods using the Gambit and FIDAP programs to produce two different designs.For the sensitivity analysis, we manipulated the boundary temperatures of the shelf and the liquid nitrogen as well as the convective

coefficient for the ambient air in the shelf design.We determined that the shelf freezing method was the most optimal for the freezing of the vial when we lowered the shelf temperature due to the small differences in the freezing times between the two methods.

title: Freezing a Fillet-o-Fish
abstract: The frozen food industry is a billion dollar industry that demands efficient manufacturing of consumer products. Through modeling the freezing within a fish fillet, the process of storing and distributing this product is better understood. The purpose of this experiment is to determine the time to freeze a fillet of tilapia (Oreochromis aureus) of known shape and properties. Then through utilizing the fillet temperature, the shelf life or freshness is determined through a consumer based freshness test that provides a nominal shelf life for common species, including tilapia. Another objective is to determine the bacteria concentration of Pseudomonas aeruginosa, common bacteria found on fish and other seafoods, during and after freezing. Using Gambit and FIDAP, a three dimensional slab of 10cm x 5cm x 2 cm was modeled in a -4?C freezer where each side was exposed to convection except for the bottom which was simulated as resting on a surface (a shelf in the freezer). This fillet model froze in ~ 45 minutes and the shelf life was determined to be 22 days, according to the industry freshness chart by Dr. Joe Regenstein. The initial concentration of the Pseudomonas aeruginosa was 1x105 CFU (colony forming units). After freezing, this concentration decreased to 9.8x10-4 or 0.2%.

title: Optimization of Chemotherapy for Lung Cancer
abstract: Chemotherapy is a common treatment method for lung cancer. Using FIDAP, this study simulated the diffusion of the drug, Cisplatin, from the blood stream throughout a lung tumor that partially blocked an airway. Two treatment methods were compared by the level of exposure (area under the concentration vs. time plot). One method was a single dose at time zero and the other method was the same dose spread over an entire day.
The results show that both methods have nearly the same levels of exposure (AUC). The main difference between the treatments was a higher peak concentration with the single dose. It was also shown that diffusivity had a significant impact on the peak concentration and level of exposure.

title: Ferromagnetic Thermal Ablation of Prostate Tumor
abstract: There are many forms of treatment for prostate cancer. One set of treatments is called hyperthermia, the heating of tumor tissue to destroy it. Thermal ablation is a form of hyperthermia that destroys both normal and cell tissue. It occurs at temperatures of about 46 C or above. Heating is accomplished via various methods that have their own advantages and disadvantages. Furthermore, heating can be local, regional, or whole-body, meaning it can focus on small specific location, large organ areas, or the whole body. Our project focuses on ferromagnetic heating of local tumors. Ferromagnetic materials are magnetic materials that heat

under an alternating, appropriately oriented, magnetic field. They heat until they reach their Curie point, the temperature at which they become non-magnetic and stop heating. The advantages of ferromagnetic heating is that is self-regulating since ferromagnetic implants will not heat beyond their Curie point, it can be easily localized since implants can be inserted in various configuratoins, it is repeatable if the implants do not degrade, and it is relatively inexpensive. Our goal was to simulate, via computational methods, the work done by Thermal Ablation Technologies, a company that designs ferromagnetic heating systems for thermal ablation of prostate tumors. We will examine the results of computer simulations of single implants and an array of implants. These results will be displayed in the form of temperature contours at specific times and temperature-time history plots at specific locations. We will determine from our analysis which parameters of ferromagnetic implant design are most crucial.

title: Making Your Sausage Clean. The Art of Sausage Sterilization
abstract: Thermal processing of temperature and species within a sausage were modeled using FIDAP. A mesh was created in GAMBIT to recreate the sausage geometry; diameter = 0.072m and length = 0.21m. The sausage was assumed to be axis-symmetric, therefore one-quarter of a cylinder was modeled and used for analysis. A three step heating process was implemented using the time function in FIDAP: (1) smoke for 1 hour at 140 degrees Fahrenheit, (2) smoke at 160 degrees Fahrenheit, (3) smoke at 180 degrees Fahrenheit for two hours or until internal temperature reaches 155 F. The destruction of Escherichia coli O157:H7 was analyzed. At the end of the three-step process (14400s), the sausage center reached its final temperature and all E.coli were destroyed.

title: Delayed Effects of Hydrofluoric Acid Burn
abstract: Hydrofluoric acid burn is a common work related injury. After initial contact, hydrofluoric acid diffuses through the skin where it eventually reaches the bone. Once in contact, dissociated F- ions react with the calcium in the bone forming calcium difluoride. Because of this mechanism, exposures often go undetected until the internal damage is extensive and patients experience excruciating pain.
Therefore, it is the purpose of our project, using finite element analysis, to model both the diffusion of HF through the skin and fat as well its reaction with calcium once it reaches the bone. We will attempt to determine the pattern of HF diffusion within the skin, fat, and bone layers; and most importantly, the time it takes for HF to reach the bone where irreversible damage occurs. We will also aim at determining the exact extent of the damage to the bone as a function of time. Finally, in our analysis we will vary the concentration of HF, its drop size, and the diffusivity of the dermal layers, and examine the effects on our results.

title: Drug Delivery in the Brain
abstract: In this study, the diffusion of nerve growth factor (NGF) from a polymeric matrix into brain tissue was simulated using the finite element method (FEM). Two release profiles were studied and it was

found that a constant release rate was a much better candidate than the normal release profile achieved by a disc. The concentration profile at various points in the brain created by a constant release rate showed a sharp increase toward a steady state concentration. This is opposed to a giant spike in concentration, which subsequently drops to zero that was the result from the normal release profile. The implications of this study are that for the release of therapeutic compounds into the brain, a constant release implant is much more desirable because it avoids a huge concentration spike at the start, which can cause harmful effects, and can maintain a steady state concentration.

title: Heat Treatment of an Enlarged Prostate
abstract: An enlarged prostate, known in the medical field as either benign prostate hyperplasia or benign prostate hypertrophy, is a common affliction among older men, resulting in a difficulty in urination. The condition is also dangerous because it can lead to infections of the kidney and bladder. A stent, made up of a shape memory alloy, such as nitinol, inserted in the urethra can serve as a means to rectify the problem ? the stent can deliver heat to the prostate, killing the obtrusive tissue. The goal of this simulation is to determine the time and power required to heat the stent to a point where a sufficient amount of inflamed tissue is killed while maintaining healthy tissue. Using GAMBIT to establish the geometry of the prostate and surrounding tissue, FIDAP can be implemented to solve the heating of the prostate by the stent. Temperature and damage profiles can be obtained to determine the appropriate wattage application and time for the procedure. We determined that the optimal way of heating was to use a lower heat flux for a longer time.

title: Project Euclid and the ArXiv: Complimentary and Contrasting Elements for Sustainability
abstract: This is an edited version of remarks presented at the "Workshop on Sustainable Models for University-Based Scholarly Publishing," conducted at Columbia University on June 1, 2004.New models of sustainability are evolving for the development and dissemination of scholarly information, but viable options are dependent on stable organizational foundations and sound managerial and financial models. My remarks today are not designed to provide an overarching vision for the future of scholarly publishing, but are intended to elucidate factors critical to the success of such visions. I am pleased to have this opportunity to review with you strategies presently being employed by the electronic publishing program of the Cornell University Library. I will focus on two particular research publishing endeavors, Euclid and the physics, mathematics, and computer science e-print arXiv. These two alternative publishing instances offer us a lens through which to analyze elements critical to sustainability. Their very different operational models illustrate differences in sustainability strategies, and yet there are important similarities between the two.

title: Thermal Effects of Laser Eye Correction on the Cornea
abstract: Eye laser surgery such as Photo Refractive Kerotectomy (PRK) has been the most recent technology towards correcting vision disorders. However, 20/20 vision is not guaranteed and side effects are possible. By

measuring the properties of the patient's cornea, the surgeon can customize the laser surgery procedure for more accurate results. Using GAMBIT and FIDAP, two dimensional (2D) design simulations of the cornea in contact with a laser beam were used to determine the optimal surgical time for laser eye correction. Three dimensional (3D) simulations were designed for an off center laser and four coupled lasers in contact with the cornea. Results indicated a directly proportional relationship between corneal density and conductivity with ablation time. An indirect relationship existed between laser power and time for ablation. Design simulations indicated a longer ablation time compared with centered lasers, but can be useful for specific vision disorders such as hyperopia.

title: Heart Cryopreservation
abstract: Heart disease affects many people and heart transplants are becoming more common. Limited shelf life is a major hindrance to the success of heart transplants. Cryopreservation opens an avenue for increasing shelf life. Our goal in this study was to model the preservation of a heart using finite element software to determine the time needed to sufficiently cool the heart and to compare the average temperature to the maximum temperature of the heart. We found a range of minimum times varying with material properties of the heart. We concluded that computer simulation can be used to approximate the minimum time needed to reach a desired maximum temperature. We also found that average temperature of the heart during cooling was not an accurate approximation of the maximum temperature.

title: Prostate Cryosurgery with Various Numbers of Probes
abstract: Cryosurgery is an increasingly popular way to treat prostate cancer. This process includes inserting one or more probes directly into the prostate to freeze the whole tissue and kill the cancer cells. The number of probes is a determining factor for the effectiveness of the procedure. In our project, we varied the number of probes to see how much of the prostate is frozen in twenty minutes. We used an argon cryogen system with probe temperature of -150oC. Using FIDAP to model the freezing of the prostate, we looked at the temperature data of nodes 2 cm away from the center of the prostate after 20 minutes. For the 1 probe model, the average temperature of the tissue was 25.76 deg C, for the 3 probe the average was 1.05 deg C and for the 5 probe, -16.97 deg C. From these results, it is evident that 1 probe is insufficient for prostate freezing since the temperature only went from 35oC to 25oC in twenty minutes, a mere 10 degree change. Even three probes will be inefficient for prostate freezing since it was twenty degrees away from reaching the optimal temperature of -20oC. We recommend using 5 probes for prostate freezing and looking into using even more probes for more time-efficient freezing. A colder cryogen would also lead to faster cooling. Our model used an argon system; liquid nitrogen with temperature -196oC could be a better alternative.

title: Thermal Burning and Its Effects on Human Skin
abstract: The objective of this paper is to model thermal burning due to application of a heat source, in

the form of a cylindrical disc, through the three distinct layers of human skin, the epidermis, dermis and subcutaneous fat. The temperature of the disc was varied from 50 to 80 degrees Celsius, and was applied for 20 seconds. After the disc was removed, the exposed skin experienced natural convection at ambient air temperature. Metabolic heat generation and blood perfusion in the dermis were taken into consideration. We modeled heat conduction in the skin, tissue damage as a function of time and temperature, and finally, we determined that metabolic heat generation and blood perfusion heat were negligible. The following report introduces our problem, discusses the methods used to generate results and the results obtained, and finally presents our major conclusions and recommendations.

title: Cryogenic Freezing of the Entire Prostate Gland
abstract: The goal of this study was to model cryogenic freezing of the entire prostate, using five cryoprobes, while minimizing damage to the surrounding tissue. A 3-D model was attempted, but failed due to time constraints; therefore, a 2-D model was constructed. It was determined that probe placement was the key factor in minimizing the time required to freeze the prostate and the extent of damage to the surrounding tissue. Varying probe temperature between -180 deg. and -195 deg.C had little affect on these results. We also increased the temperature of the center probe outside of the range currently used for this procedure. This decreased the frozen area below the prostate where the rectum is located.

title: Heat and Moisture Transport in the Nasal Cavity
abstract: The intake of air into the lungs is obviously a vital process for the survival of humans, and the conditioning of this air from ambient to alveolar is a necessity accomplished primarily in the nasal cavity. The human nose is capable of taking in air of nearly all conditions (hot, cold, dry, moist) and properly maintaining the required equilibrium. Increased awareness of nasal diseases, the use of drugs to aid in breathing, and surgeries (cosmetic and medical) have placed a premium on the understanding of the dynamics of the heat and water vapor transport phenomenon. This report takes a two-dimensional cross section and models flow past the inferior turbinate, producing velocity, temperature and water vapor profiles for normal breathing conditions and shows a control when the turbinate is not present. The results show that the turbinate (concha) is vital for processing the air to alveolar conditions. The results obtained at the exit match those in previous literature -- nearly saturated and near body temperature air leaves the cavity when the concha is present. However, the air is considerably closer to ambient conditions when turbinate is not present.

title: Frostbite in Ithaca: A Walk to Riley-Robb
abstract: Frostbite occurs when body tissues freeze after being exposed to extreme cold and wind. It's most likely to occur on body extremities ? fingers, nose, ears, and toes ? areas far from the warm body core and exposed to the elements. We have modeled tissue freezing in a finger in order to predict combinations of wind speed and temperature likely to lead to frostbite. Our model incorporates different tissue layers in the

finger, sources of heat, transient properties, and heat transfer through convection and conduction. Such a model is valuable because it accurately predicts the existence and extent of tissue freezing.

The model uses two tissue layers in the finger because of their disparaging material properties. It also contains a region attached to the finger to simulate heat flux from the hand to the finger. Heat generation was ignored, and heat transfer to the finger from blood flow was accounted for by a source term. The model is axi-symmetric, with radial heat flow into the finger. The edges of the finger have a convection boundary condition, and the region attached to the finger was perfectly insulated. The far edge of the region attached to the finger was set to a constant temperature equal to average body temperature.

Each simulation was performed for a time span of thirty minutes for each set of ambient conditions. We then noted whether or not the conditions were conducive to frostbite. A sensitivity analysis was performed to ensure that the solutions converged.

title: Cold Therapy Analysis in Structurally Damaged Tissue
abstract: For our project, we conducted an analysis of cold therapy for structurally damaged tissue. Our intent was to determine the ideal conditions of temperature and time of cold therapy needed to most effectively treat a bruise. To do this, we devised a model of damaged tissue via GAMBIT and FIDAP and exposed this tissue to cold therapy at varying temperatures and times. We created a function to assess effectiveness of treatment which was dependent on the depth of penetration at 34 deg. C (ideal temperature for treated tissue) and the depth of penetration of 5 deg. C(temperature at which vasodilation occurs in order for the body to maintain homeostasis). The significance of this effectiveness value is that it is an indication of how effectively we have reduced blood flow in and surrounding the damaged tissue layers. A high effectiveness value translates into significantly reduced blood flow which mitigates the extent of damage. The applications of our findings could be put towards devising an ice pack/gel pack which is maintained at an appropriate temperature and left on an injury for an appropriate time.

title: Accidental Freezing of the Tongue to Metal Poles
abstract: In an attempt to verify the age-old claim that your tongue will freeze to a metal pole and become stuck if you decide to lick it in the midst of winter, we have modeled tongue contact with a cold metal surface using finite-element analysis techniques. After varying ambient temperatures, we have concluded that accidental tongue-freezing is not a myth, and below -5 deg. C the tongue will freeze before it can be removed. An accompanying sensitivity analysis showed that variations in contact area, metal properties, and the convection coefficients do not significantly change this conclusion. Our simulation has opened the possibility for further study of the accidental freezing process, including the modeling of methods to remove the tongue once it is stuck.

title: Computer Aided Simulation of Varying Viscosities in Orange Juice Pasteurization

abstract: This project presents a FIDAP simulation for determining the effect of viscosity on the process time required to pasteurize orange juice of varying Brix* . Destruction of C. Botulinum and Ascorbic Acid (Vitamin C) were also modeled.
Process time was found to be positively associated with viscosity, up to 30* Brix. There was a high retention of Ascorbic Acid for all concentrations. The highest retention was found with the 10*Brix juice. The highest bacterial destruction of approximately 0.5 log reduction was attained for an axis temperature of 73*C with the 35* Brix juice. Because FDA requirements specify a 5 log reduction, a holding tube needs to be added.

title: Numerical Simulation of Natural Convection Heating in Canned Foods Containing Solid Particles
abstract: In this work we investigated the influence of solid particles on the heating of canned foods. A numerical model for natural convection heating of liquids developed by Datta and Teixeira in 1987 was used for predicting the values of temperature and velocity inside a can filled with liquid and grain. The solid particles influence the buoyancy that drives the flow during the heating of the can, and this problem has not been solved until now. As a first attempt to solve it, we assumed a radical simplification and treated the system composed of liquid and particles as a porous medium. FIDAP (Fluid Dynamics Analysis Package) was the finite-element-based software used for simulating the fluid and heat flow. The plots of distribution of temperature and velocity in the cans showed that the qualitative behavior of both cans (liquid and liquid+grain system) was the same: the liquid near the hot wall becomes lighter and rises, there is radial flow near the top and uniform flow near the centerline. In conclusion, we observed that the solid matrix reduces the magnitude of the velocities by approximately 10% and slows down the distribution of temperature in the can filled with liquid and grain.

title: Angiography
abstract: This paper explores the use of Computer Aided Engineering (CAE) to model angiography dye flow in the detection of cerebral aneurysms. To obtain a discernable image, the concentration of the dye, Conray-60 ? , needed to be above 0.2 in the desired region. The design goal was to optimize the appropriate dye injection catheter diameter while maintaining dye flow rate constant to provide the longest time window to take an angiogram of the carotid artery. A geometric model of the system, consisting of a tubular 5 mm diameter artery of 0.3 m in length with the catheter outlet at the beginning of the tube, was produced using the graphical program GAMBITTM. After specifying initial and boundary conditions of the model, including velocities and concentrations, the CAE program FIDAPTM was used to compute the resulting fluid velocity and concentration change of the imaging dye, Conray-60? . Analysis was performed using a 2 mm diameter catheter and a 3 mm diameter catheter. The time window was obtained by finding the amount of time when the entire length of the region 5 cm from the inlet to the end of the tube maintained the desired concentration. For the 2 mm catheter, the time window was determined to be 1.5 seconds. The 3 mm catheter provided a time of 1.3 seconds. This analysis concludes that a smaller catheter provides a larger time window for the purpose of taking an angiogram when the flow rate cannot be changed.

title: Heating Effects of Dental Drilling
abstract: Drilling causes pain in the tooth for various reasons. This paper addresses the heating of the pulpal region due to friction from drilling. The heating may depend on such parameters as the speed of the drill, water supply, and the rate of drilling. By coupling the semi-infinite geometry of a tooth with complex mechanisms of drilling, it may be possible to optimize the conditions of drilling such that the patient feels minimal pain. Modeling the above process on the computational software called FIDAP, we concluded that higher drill speeds correlate to the reduction of perceived temperature, and thus, pain level.

title: Water Flow and Heat Transfer Pattern in a HPS lamp
abstract: The purpose of this report is to model a High Pressure Sodium (HPS) light bulb. Velocity and heat transfer profiles were computed to determine the optimal configuration of heat evacuation using a liquid coolant. In this simulation, water is forced over the bulb to evacuate the large amount of heat that the HPS system produces. The results obtained show the velocity and heat transfer profiles for varying geometries of the HPS bulb. These conclusions can be used to optimize both the flow of coolant and the position of the inlet and outlet on the outer jacket to maximize operating efficiency.

title: The ABC's: Atherosclerosis, Blood Flow, and the Carotid Artery
abstract: The effects of blood flow were analyzed in the carotid artery, using computer aided engineering software (FIDAP and GAMBIT). The study was conducted because patients that have atherosclerosis often have plaque build up on the interior walls of the carotid artery directly before bifurcation. The design objectives were to analyze the velocity and shear stress through the carotid artery as the common section splits into the external and sinus sections. The results obtained demonstrated minimal velocity and shear stress in both the sinus and external sections of the artery. These differ from the expectations. In reality neither velocity nor shear stress decrease to this extent in normal blood flow through arteries. The results should have shown a decrease in both velocity and shear stress directly before the bifurcation. The plots obtained did demonstrate decreased velocity near the interior walls of the artery, as expected. Errors in the results relate to numerical problems with meshing. Further studies should be conducted to improve upon these results and include more realistic, less simplified parameters.

title: Renal Tissue Preservation: Cooling the human kidney for optimal transport conditions
abstract: End Stage Renal Disease affects over 80,000 Americans each year. While there is no known cure, kidney transplants are the most effective way to combat the disease while bettering the quality of life for the patient. In this study, we implemented computer aided engineering in order to determine how a kidney cools during the time between harvest and transplantation. Our goal was to sustain the organ as long as possible

outside the body while controlling for temperature and oxygen supply. We found that oxygen concentration of the kidney is only dependent on the boundary condition placed on the oxygen, and not at all related to the cooling rate. Our results showed that perfusion is beneficial because it is able to maintain the necessary amount of oxygen required for the kidney to sustain its own metabolism.

title: Three Frontiers in Open Access Scholarship
abstract: There are three important frontiers in moving from subscription-based scholarly publications to delivery of scholarly works to readers without charge via the Internet. First are automated archives of preprints and post prints that do not require formal editorial review before posting. The arXiv service, now at Cornell, is emblematic of this frontier. (arXiv, 2004) Second are the quality-assured journals that are distributed on an open-access basis. The Public Library of Science initiative in launching journals in biology and medicine is emblematic of the second frontier. (Public Library of Science, 2004) Third are open access indices to the scholarly literature. Google Scholar, launched in beta version in November 2004, is emblematic of this frontier. (Google, 2004) Each frontier advances the prospect that the best scholarship will be readily available to all via the Internet. Our goal here is to identify where each frontier is today and how it may evolve.Vanderbilt University

title: Animal Science at Cornell University 1963 - 2000: Observations and Reflections of an Insider
abstract: A professionally printed and bound version may be obtained by contacting: Dorothy I. Ceurter, Animal Science Department, 149 Morrison Hall, Cornell University, Ithaca, NY 14853This is an update to the 1987 book by Kenneth L. Turk, Animal Husbandry at Cornell University: A History and Record of Development from 1868 to 1963 prepared by a retired (1991), succeeding Department Chair, J. Murray Elliot. Former chairs provided suggestions of what they considered significant items during their administrations. From the beginning it was agreed that this volume would be relatively brief, without some of the detail that characterized Ken Turk's history. Somme additional information has been made available on the department web site (www. ansci.cornell.edu), rather than including it in the new volume.
Although individual faculty members have received numerous local, regional, national, and international awards recognizing their superior accomplishments in research, teaching, and extension, no attempt has been made to develop an exhaustive list of such honors. Where deemed appropriate, however, many of the more important of these awards are woven into the narrative. The present effort also differs from Ken's in many other respects and is more accurately described as "observations and reflections" than as "history". No doubt my items worthy of note during that and especially other time periods have been overlooked.

title: Saturable Nonlinearity and Stable Multi-dimensional Optical Solitons
abstract: Stable multi-dimensional optical solitons have been predicted to exist in saturable instantaneous Kerr-like nonlinear systems for many years. The experimental observation of these objects is interesting scientifically and can have important applications. However, to date no experimental observation has been reported.
The prospects of realizing these predicted phenomena depend on the accessibility of the nonlinear parameters in a physical feasible system. To address this question, we first develop a systematic way of determining the nonlinear properties of materials based on the previously developed spectrally-resolved two-beaming coupling measurement. This new method is used to measure the nonlinear properties of several materials. The results are used to assess the prospects of producing stable multi-dimensional optical solitons in saturable instantaneous Kerr-like nonlinear systems. We conclude that the prospects for producing three-dimensional solitons are poor. However, it is more likely to succeed in producing stable two-dimensional optical solitons. title: REPORT ON CRITICAL DIMENSIONS AND PROBLEMS OF THE NORTH KOREAN FOOD

SITUATION
abstract: This paper suggests one possibility for the elimination of poverty in North Korea. Despite its efforts to increase food production, North Korea has been suffering a serious food shortage problem. Under the current political and economic system, it is very unlikely that North Korea by itself can supply adequate food to its people. A viable way to solve the chronic food shortage is to change government policies regarding the kind of crops farmers raise. Instead of pushing for increased grain production, the government needs to encourage farmers to raise non-grain crops, which can be exported to South Korea or Japan. Since prices in the South are much higher than those in North Korea, exporting non-grain crops and importing grains would be more profitable to the North Korean government than producing more grains in the current system. In order for such a change to be successful, the North Korean government must try to reduce transportation costs and facilitate construction and utilization of railroads and roads between North and South.

title: Ripening Conditions for Reds and Measurements to Assess Ripeness: A Burgundy Model
abstract: The quality of the food products from raw material is generally dependent on phenolic compounds, mainly in the case of grapes and wines. In Burgundy, the phenolic composition of Pinot Noir grapes can be very different from one year to another one. Since a few years, we have been trying to measure the phenolic compounds evolution in the berries in order to be able to choose the best time for harvest. In Pinot Noir seeds the tannins are low molecular weight (Mr) condensed molecules and may contribute, in so far as they are released into the medium, to organoleptic qualities. Examples will be presented to compare in the same area, the phenolic composition of the grape berries, the extractibility of both anthocyanins and proanthocyanidins, and the wine composition.

title: Brettanomyces in Wine
abstract: The Brettanomyces / Dekkera yeasts can be found in fermenting must and in wine. Typically they grow after alcoholic and malolactic fermentation during storage of wine in tank, barrel, or bottle. They contribute characteristic bretty flavors which are described as smoky, barnyard, plastic, burnt plastic, vinyl, Bandaid, and creosote. They can also contribute a metallic bitterness. Compounds which are responsible for brett flavor in wine include 4-ethyl phenol, 4-ethyl guaiacol, isovaleric acid, and unidentified burnt plastic compound. Descriptive sensory evaluations show an inverse relationship between fruity and bretty flavor perception. The brett aromas in some wines are considered a positive attribute, especially when present at low concentration. Often these flavors are considered a defect. The wine's varietal and regional flavor characteristics might be completely masked by these flavors and the wine can be unpleasantly bitter. 4-ethyl phenol is used by some wineries as an indicator compound for the activity of Brettanomyces. Yet some wines having a strong brett flavors do contain none or very little 4-ethyl phenol. Preliminary studies show that 4-ethyl phenol is formed all through growth of Brettanomyces. Thus this compound can be used to confirm the presence of bretty flavors. The search for indicator compounds formed during early stages of growth of B. continues. The Brettanomyces yeasts can produce the characteristic brett flavors when growing at low cell density of several hundred to several thousand cells per mL. The fact that these yeasts are often present at low cell numbers and that they are slow growing makes detection difficult. Genetic analyses of wine isolates have shown that only strains of B. bruxellensis grow in wine. Semi-selective plating is performed prior to genetic analysis on media including cycloheximide. The development of DNA based probes has made it possible to reliably identify the yeast once it is plated on a nutrient agar plate. Further developments of specific probes and of probe application techniques will improve the specificity and speed of detection.

title: Molecular Identification of Brettanomyces yeasts
abstract: Brettanomyces/Dekkera yeasts grow in wine mainly during barrel aging. Their presence is often associated with formation of off-flavors. This potential spoilage generates a high demand for a fast, sensitive and reliable identification procedure in the food industry. Presently, these exigences are only fulfilled by the use of genetic techniques. In addition to yeasts from type culture collections Brettanomyces yeast strains isolated from Cabernet Sauvignon wines characterized by winemakers panels as having 'bretty' aromas were extensively analyzed in this regard. Brettanomyces/Dekkera reference strains from a type culture collection were included for comparison. Whereas karyotyping and chromosomal RFLP resulted in clear distinctions it did not allow for relatedness studies due to the lack of pattern conservation among species and strains. Conversely, i) ribosomal DNA restriction fragments length polymorphism, ii) comparative sequence analysis of the two internal transcribed spacer (ITS) regions located between the ribosomal RNA genes and iii) RAPD-PCR allowed for species discrimination within the genus Brettanomyces and strain discrimination within the species B. bruxellensis. All wine-isolated Brettanomyces/Dekkera yeasts belonged to the species B. bruxellensis. Cabernet Sauvignon wines were chosen from the seven vintages 1989 and from 1991 to 1996. Merlot, Chardonnay, and Sauvignon blanc were taken from vintage 1995. All wines originated from the same winery. Whereas populations of one single or two strains were found, one strain always dominated in the examined wines. Populations of two clone A and B were found in 1989 in the ratio of 90% to 10%. Clone B was not found in 1991 but clone A completely dominated. Populations derived from clone C were found in 1992 (100%), 1993 (90%), 1994 (100%), 1995 (90%), and 1996 (70%). Clone D started to evolve in 1995 (10%) and was present in the following year 1996 to 30%. Clone B which was present in 1989 (10%) was not found any more in the following vintages. Brettanomyces yeasts were found in Merlot, but no yeasts were found in the two white wines. This established procedure for the first time makes the determination of Brettanomyces yeast possible thus allowing to learn about their successions in wine.

title: Impact of Brettanomyces Yeast on Wine Flavor: Sensory Description of Wines with Different
abstract: Growth of the yeast Brettanomyces/Dekkera in wine can drastically alter the aroma characteristics to the point where all varietal and regional flavor characteristics are overwhelmed by the flavors produced by these yeasts. To avoid spoilage it is important to know more about the aromas formed by these yeasts and be able to detect the changes in aroma early so that further growth of the yeast and further aroma modification can be avoided. Two groups of commercial wines with suspected "Brett" character were evaluated by two trained panels of judges. The first group included four Cabernet Sauvignon and two Pinot Noir wines; the second included four Cabernet Sauvignon wines. All were evaluated by sensory descriptive analysis and GC/MS 4-ethyl phenol analysis. Characteristic "Brett" aromas such as plastic, burnt plastic, Band-aid (TM), cow manure, barnyard, and horse sweat were summarized by the first group of tasters as 'plastic.' For the second group 'plastic' included only pastic, burnt plastic, and Band-aid (TM) odors. Dry manure and sweaty/animal were separate descriptors. In both groups, the wines were differentiated by univariate analysis of variance (ANOVA) and multivariate discriminant analysis (DA) by two descriptors: plastic and fruity. The greatest fruit character and lowest plastic scores defined the younger Cabernets, and the opposite was true for the older wines. There was little difference between the two Pinot Noirs for either descriptor. The a priori "Brett" observations from the winemakers proved to be a consistent predictor of Brett character for all wines. The observations also agreed with the 4-ethyl phenol concentrations and the post-hoc plastic mean scores from

the ANOVA analyses. The "strong Brett" wines were the older vintage wines with higher 4-ethyl phenol concentrations, higher plastic and lower fruity mean scores. Wines with "maybe some" and "no Brett" had the lower 4-ethyl phenol concentrations and more fruit with less plastic scores. This investigation shows that aroma modifications by Brettanomyces yeasts can be reliably detected and quantified with trained tasters. Further investigations into the chemical basis of the 'Brett' aromas will allow us to use chemical indicators to detect activity of these yeasts early.

title: Color and Tannin Stability: Influence of Microaeration and Enological Tannin Addition
abstract: It is well known that the stability of color is under the influence of the anthocyanins and tannins complexation. The traditional vinification technique relies on high temperature to liberate more anthocyanins and then a long maceration to extract tannins, to stabilize this color. The problem is that anthocyanins are very unstable, and can precipitate during fermentation.
There are now tools to avoid a part of this instabilization: use of extraction enzymes which liberate grape tannins at the begining of the AF, use of certain yeast strains (production of polysaccharides), use of enological tannins in fermentation or just after, and microaeration. These last two techniques will be discussed.

title: Basics of Water Balance in New York Vineyards
abstract: In the humid climate of New York and the Northeast, rainfall is erratic and therefore drought stresses are not easy to predict. Do we have significant problems due to drought (significant enough to change cultural practices or invest in irrigation)? We know the answer depends on how dry the seasons are, how much water our vineyard soil holds, how much the vines need. Since we cannot predict the weather, we must take a risk assessment approach, and then evaluate methods to reduce risks we find. To do that we need to understand the factors that either increase or reduce our risks of significant loss from drought stress.

title: Comparison of Pinot Noir Production in New York and Burgundy, A
abstract: New York State has long been recognized for its leading edge in the production of Concord and Niagara grapes for juice products. More recently, New York has experienced great growth in its wine related industry. With 33,000 acres of grapes under production, New York ranks second to only California in wine production. The number of wineries has increased rapidly in the past 20 years, from approximately 20 to over 125 today. In 1976, the Farm Winery Act was first passed, resulting in explosive growth of the wine and grape industry and the development of numerous farm wineries.
The moderate climates of the Finger Lakes area, the Lake Erie escarpment, the Hudson River Valley and Long Island simulate some of the best grape production regions in France and Germany. Pioneers of the grape growing industry in New York worked diligently to introduce classic Old World style grape cultivars such as Riesling, Chardonnay and most recently Pinot Noir. The microclimates encountered in this diverse state

have supported the production of high quality Vitis vinifera cultivars and today winemakers on Long Island, in the Hudson Valley, the Finger Lakes and along Lake Erie are winning international wine competitions and gaining some market share. New York is starting to show that it can produce excellent wines in various regions around the state.

New York State has a variable climate in each of these regions and in fact, this microclimate, its soil, and viticulture, or terroir, is thought to impart very specific and characteristic qualities to the wine products produced in each of these regions. The climate, mineral soils, sunlight and water availability of the Finger Lakes Region are in fact, reminiscent of the conditions observed in Burgundy France, the home of the popular and complex grape, the Pinot Noir.

title: Cost of Establishment and Production of Vinifera Grapes in the Finger Lakes Region of New York, 2001
abstract: In recent years there has been increased interest in the Finger Lakes, as well as in other producing regions in New York state, in planting Vitis vinifera grapes for premium wine production. Red varieties such as Pinot Noir, Cabernet Sauvignon, and Cabernet Franc all experienced increased acreage in the most recent orchard and vineyard survey compiled by The New York Agricultural Statistics Service.
Several factors are affecting the interest in new V. vinifera plantings. First is the declining real prices (adjusted for inflation) or in some cases, declining nominal prices for traditional American wine varieties and some French American hybrid varieties (e.g. Aurore, Catawba, DeChaunac, Delaware, and Dutchess). A second factor has been an increase in consumer demand for quality wines (roughly defined as French American hybrid or V. vinifera varietals or appellation wines). Wine consumption in the United States has increased during the last seven years, driven by good news regarding the health benefits of moderate wine consumption. A third factor is that most Finger Lakes wineries are reporting increased winery visitation by tourists as well as local area repeat purchasers. Well-managed wineries in the Finger Lakes are reporting annual sales increases of ten to as high as 25 per cent over the last several years. In addition to the increase in the number

of tourists resulting from promotional efforts that have been made by several local agencies, New York is gaining stature as a producer of high quality wines that command premium prices.

Growers who are considering planting additional V. vinifera acreage need to carefully weigh the cost of planting and establishing a vineyard, the cost of production of a mature vineyard, and the expected yields and prices in order to determine whether the investment of $13,000 per acre or more required to bring a V. vinifera vineyard into production will result in a profitable return on investment. This question is complicated by the long-run nature of the investment (payback periods are in excess of ten years and can be even much longer), as well as the risk from an over supply from significant plantings of wine grapes worldwide that could lead to price cutting at the retail level. There has been a great increase in new plantings of V. vinifera in California. By some estimates, nonbearing or not yet mature acreage in California is now 100,000 acres (Wines and Vines). Although the New York industry is somewhat insulated by a market structure of the premium wine sector that is based on most wineries selling over 50 per cent of their wine (volume) through direct sales, wineries cannot expect to be completely unaffected if national supply outstrips demand in the future. The acreage of V. vinifera varieties in the Finger Lakes is still quite limited. For example, the two most widely planted V. vinifera varieties, Chardonnay and Riesling, accounted for just 314 acres and 231 acres, respectively, in the most recent survey of acreage by New York Agricultural Statistics. Given the limited area planted, a small increase in planted acreage can have a large impact on supply when the new acreage begins bearing.

The objective of this project was to determine the cost of producing V. vinifera grapes in the Finger Lakes region in a commercial sized operation. Estimates of the total investment in land, machinery, vineyard establishment and development costs, and annual operating costs were developed.

These estimates may be used by growers and potential investors to compute and analyze the costs and profit potential for their own situations. The estimates are not necessarily representative of average costs for grape production in the Finger Lakes, but rather are typical costs for well-managed vineyards using recommended practices. The yield estimates used for estimation of typical returns assume better sites (well-drained, productive soils with appropriate slopes for air drainage). We also assumed that vineyard practices were used which would result in premium quality grapes. Practices such as leaf pulling and cluster thinning of certain varieties, would limit yields and contribute to higher quality wine. Poorer sites and/or failure to follow optimal management practices can have a significant negative impact on the earnings estimates presented in this publication.

title: Atypical Aging, The: A Surway
abstract: Atypical Aging (ATA) was first detected in Germany in 1988 in the wine growing area in Franconia. Thereafter, in all the German wine growing regions ATA was expressed more or less severe. It was detected in all white wine varieties and also in Ros? wines, but never in red wines. Mainly it was found in light wines, like base wines for sparkling wines. In over-cropped vineyards and in such with a low water table, that means on dry sites. Looking around whether this phenomenon is a solely German problem, it quickly became clear,

that this unpleasant odor defect can be found around the world. In Europe ATA has been detected so far in Austria, Switzerland, Italy, and France. But also it has been found overseas. In wines from the Finger Lakes it has been recognized for several years, but it was not taken into account as a separate fault. Originally it seen as a fault coming from mixing native American or American-French hybrid wines into a vinifera wine. But California, Oregon, Australia, New-Zealand and South Africa experience this defect. If some more countries would show the fault in their wines, it would not be surprising.

title: Result of Brett Survey in Finger Lakes Pinot Noir
abstract: Brettanomyces bruxellensis has been associated with wines which exhibit off-flavors and odors described as "burnt plastic," "wet wool," "horse sweat," and "barn yard." The yeast can grow in wines at very low cell densities and can withstand the combined stresses of acetic acid, free SO2, tartaric acid and ethanol. Brettanomyces bruxellensis tends to overproduce acetic acid and convert fruity phenolic compounds into undesirable aromas such as 4-ethylphenol and 4-ethylguiacol which give wine burnt plastic, Bandaid (R), plastic, and barnyard aromas (Chatonnet et al., 1992, 1997; Licker, 1998; Arvik, 2002).
These products are malodorous by themselves, but small concentration of "bretty" aroma compounds may increase the wine's aroma complexity if they are kept at concentrations near the odor threshold. Some winemakers are convinced that any amount of Brettanomyces is bad for a winery. Others like the character that some B. bruxellensis strains may give an under-ripe, simple fruity wine. Because there is evidence for the global presence of "Brett" (Fugelsang, 1997), the issue has become more of an immediate priority for wine researchers. We have isolated Brettanomyces from several NY wines as well as from bottled wines from other parts of the USA and Europe (Arvik, 2002). A wide overview on the "Brett" phenomenon was presented at the 31st Annual NY Wine Industry Workshop (Arvik and Henick-Kling, 2002).
In this research a survey on Brettanomyces bruxellensis occurrence in the 28 samples of Finger Lake Pinot Noir has been accomplished. The wines were produced in the wineries member to the Pinot Noir Alliance that supported the project submitted in 2002, as well. Moreover, more information about factors affecting B. bruxellensis wine-altering activity will be added to our database. The results were also compared to the survey previously performed on Cabernet Franc (Arvik and Henick-Kling in progress).

title: Malolactic Fermentation: A Review of Recent Research on Timing of Inoculation and Possible Yeast-Bacteria Combinations
abstract: Despite a considerable research effort, the malolactic fermentation (MLF) process remains to be an imperfectly controlled process and at times MLF can be difficult to get started. One possible explanation for this difficulty is that the wine may be lacking essential nutrient factors for the lactic acid bacteria. Another possible argument is that inhibitory substances are accumulated in wine. Sulfur dioxide and alcohol concentrations and pH have been included among the most significant parameter influencing the growth of malolactic bacteria in wine. King and Beelman suggested that the growth of Oenococcus oeni during alcoholic fermentation might be retarded by the production of toxic compounds by yeasts other than ethanol and sulfur dioxide. Moreover, the malolactic fermentability of wines produced from the same must differ according the yeast strain used in alcoholic fermentation. Previous studies have shown the inhibition

of malolactic starter cultures by active growing yeasts due to the production of high levels of SO2 during the early stage of alcoholic fermentation and the effect of acetic acid formed by Kloeckera yeasts and some lactobacilli on growth of Saccharomyces. The goal of our recent investigations is to better understand these interactions, to quantify the nutrient demand by yeast and the nutrient requirements of wine lactic acid bacteria, and to determine whether there are other synergistic interactions between S. cerevisiae and O. oeni in wine. A better understanding of these aspects of wine microorganism physiology will allow us to better match combinations of yeast and bacteria starter cultures with grape varieties, and select the timing of yeast and bacteria inoculations.

title: Biological Stability of Wine and Biogenic Amines
abstract: Biogenic amines should not be present in wines and they are always an indication for the activity of undesired micro-organisms with a high amino decarboxylase activity as found in the lactic acid bacteria Pediococcus damnosus. By microscopic control during winemaking it is possible to detect the appearance of Pediococcus damnosus and to prevent their further growth. The addition of Oenococcus oeni bacteria starter cultures can prevent or delay the growth of Pediococcus damnosus and therefore the formation of biogenic amines. By use of bacteria starter cultures and/or the microscopic control during wine-making the wine-maker can prevent the formation of biogenic amines in a simple, inexpensive and successful fashion.

title: The feeding dynamics of out-migrated age-0 chinook salmon (Oncorhynchus tshawytscha) in Lake Ontario
abstract: The purpose of this study was to examine gastric evacuation, feeding chronology, daily ration, growth, diet, and prey selectivity of recently out-migrated young-of-the-year (YOY) chinook salmon (Oncorhynchus tshawytscha) in Lake Ontario.
To determine gastric evacuation rates, chinook salmon ranging from 40-80 mm in total length, were fed to satiation and maintained at 10, 13, 16, or 19oC in the laboratory for 24 hours. Five fish were sampled randomly every four hours from each temperature treatment and the complete digestive tract (CDT) contents were removed. The CDT contents and the remainder of each fish were subsequently dried and weighed. Results show that evacuation rate (R) was dependent on temperature, with estimates of R ranging from 0.214?h-1 to 0.352?h-1, at 10oC and 19oC, respectively.
Field sampling for daily ration estimates was conducted on five dates from May 21 ? June 25, 2001. Sub-yearling chinook salmon were captured using a seine near the mouth of the Salmon River, beginning 30-60 minutes after sunrise and continuing at approximately 4-hour intervals for 24 hours. Estimates of mean daily ration ( ) were derived using the Eggers (1977) model. Results showed that gut fullness varied significantly ($p < 0.05$) with both date and time of day, but there was no indication of synchronous diel variability in gut fullness between dates. Because did not vary as a function of date ($p > 0.05$), an overall (28.3 g dry wt?100 g dry wt-1?d-1) was calculated using the grand mean for all five sampling dates.
Daily ring counts of sagittal otoliths revealed that in 2001, YOY chinook hatched between February 21 and April 2, and exhibited a mean growth rate of 0.65 mm?day-1. The early spring hatch dates indicated that the captured chinook salmon were naturally produced, as 2001 hatchery chinook hatched in November. For diet analyses, out-migrated YOY chinook salmon, along with potential prey items, were sampled biweekly, at dusk, at two near-shore sites (i.e., Sandy Creek and the Salmon River) in Lake Ontario from April ? July of 2000. In 2001, weekly diet and prey sampling was conducted from April ? July at the Salmon River site only. On five dates from mid-May to late-June 2001, prey and fish samples were collected throughout the day to assess diel shifts in prey availability and selection.
Mid-water and surface prey sampling was conducted using a 1000 ?m neuston net pulled across the surface and parallel to the shoreline in water about one meter deep. Out-migrated, age-0 chinook salmon were captured using a seine concurrent with prey samples in both 2000 and 2001. Results showed that YOY chinook salmon in Lake Ontario were primarily diurnal feeders as indicated by both a decrease in gut content wet weight and the lack of identifiable prey in stomach samples examined after midnight. Sub-yearling chinook sampled at dusk at both sites in 2000 and 2001 fed heavily on aquatic taxa, with mature chironomids constituting the bulk of the diet. Similarly, chinook salmon sampled during the day at the Salmon River site in 2001

consumed at least 71% aquatic taxa.
Moreover, there was little evidence of a diel diet shift. Although amphipods, homopterans, and developing chironomidae often dominated the prey samples, daytime diet data collected at the Salmon River site in 2001 revealed that mature chironomidae remained the most frequently consumed prey. Strauss's (1979) index of prey selection (L) revealed that in general, YOY chinook actively selected (L = 0.3-0.5) for chironomidae, while negatively selecting for non-chironomids.
This study shows that naturally produced chinook salmon are thriving in the near-shore areas of Lake Ontario and consequently have an excellent chance to recruit to the lake?s Pacific salmon fishery.Funding for this study was provided by New York Sea Grant as part of project no. R/FBF-12, 'Factors affecting early survival and management of Lake Ontario salmonine populations.'

title: Dynamics, Theory and Applications
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment.This textbook is intended to provide a basis for instruction in dynamics. Its purpose is not only to equip students with the skills they need to deal effectively with present-day dynamics problems, but also to bring them into position to interact smoothly with those trained more conventionally.

title: Unified Theory of Social Systems: A Radical Christian Analysis
abstract: For our purposes a Social System is defined as a human community whose members interact, depend on each other and are affected jointly by actions of or physical characteristics within the community. Decisions concerning actions or characteristics can be of any kind, on a broad scale ranging from absolute dictatorship to an open-ended state of most perfect democratic principles. It is precisely this notion of "perfection" that will concern us in this study; but hopefully in a more explicit, precise and less superficial and pride-loaded manner.
Next, because we want to develop a unified theory of social systems, it is imperative to include all systems in all their dimensionality -- not only in the political sphere. The major spheres or dimensions, in addition to the political (from which we have started our analysis), are social, educational, economic, health-related, family-related, affective and spiritual -- and in fact any sphere involving a social system of more than one person where some or all of the members of the system function in the sense stated above. We want to refer

to this as the ALL-INCLUSIVENESS of all SPHERES or DIMENSIONS of human society.

title: A Simple, Physical Model of Particulate Wash-off from Impervious Urban Surfaces
abstract: Particulate matter "washed-off" of impervious surfaces constitutes a large portion of urban nonpoint source pollution. However, current water quality models rely on empirical functions of particulate wash-off that do not meaningfully describe the physical mechanisms involved. In this paper, we investigate the physical mechanisms of rain-flow transportation (Moss et al. 1979), raindrop induced particle ejection that occurs in shallow flows on moderate slope. Rain-flow transport involves the interaction of both rainfall impact and overland flow, in contrast to the overland flow-dominated, shear-driven particle entrainment that may occur on steep slopes.

We propose a saltation model in which particles are ejected from an impervious surface by raindrop impacts and are translated laterally while settling-out of overland flow. Particles are assumed to be ejected in proportion to rain intensity and the spatial density of particles on the surface. Once ejected, we propose that particles move laterally at the flow velocity and settle according to Stoke's Law. We tested our conceptual model against laboratory flume experiments (10.5 cm wide, 80 cm long) in which rain intensity and upslope overland flow could be independently controlled. The surface of the flume was rough (~1 mm roughness element height) and the particles were 545 mm diameter sand grains. Rainfall rates were between 4.5 and 12.1 cm/hr and overland flow rates were between 150 and 420 mL/min. The conceptual model agreed well with observed data, R2 > 0.85 and was best at the higher overland flows. At low flows the particles spread-out across the surface more than the model predicted. We hypothesize that at low flows lateral movement arising during raindrop impact may be greater than the translation due to overland flow; more research is needed to develop a way to simulate this process. These model results provide a basis for developing a mechanistic wash-off model for spatially distributed urban water quality models.

title: Some Practical Observations on the Writing, Implementation, and Revision of Collection Development Policy.
abstract: This paper was conceived in the context of the "RTSD Guidelines for the Formulation of Collection Development Policies." It describes fundamental qualities of policy applicable to all kinds of libraries and recommends a step-by-step process leading to the the successful realization of policy planning. Placing an emphasis on the values of the process itself, the paper also suggests implications for collection development personnel and for the library as an organization, when a working policy is adapted.

title: Collection development and management at Cornell : an interim report on activities of the Cornell University Libraries' project for collection development and management, July 1977-June 1979 ; prepared under a grant from the Andrew W. Mellon Foundation
abstract: This document covers the first year-and-a-half of the Cornell University Libraries' Project for Collection Development and Management and as such is primarily a statement of the issues that the the Library faced and the investigative design that Edelman proposed to address them. The issues-- decline in acquisitions rates, concern over methodology for funds allocation, library space-- will seem remarkably contemporary. Twenty-five years on, readers will be struck by the writers' confidence that all research library activity derived from the collections and that their description, evaluation and planning would, necessarily, improve services.

title: Collection development and management at Cornell : a concluding report on activities of the Cornell University Libraries' project for collection development and management, July 1979-June 1980, with proposals for future planning
abstract: Miller's work addresses two primary audiences, the Andrew W. Mellon Foundation, which funded the two-year study at Cornell, and the University's administrators, who would assess the extent to which they would underwrite the report's recommendations. It lays out a series of activities that the library conducted to measure the Project's research design and makes specific recommendations for the organization, selection policy, budget control and planning of collection development at Cornell. The report's scope and tone-- whose principal leitmotifs are limits, controls and bounds-- contrasts sharply with the optimism of the interim report, written two years earlier.

title: The Necessity for a Collection Development Policy Statement
abstract: The heart of the library lies in its collection, and collections have to be built continuously. Budgetary constraints perforce stress the need for better defined collection development policy, although the ultimate goal should be an improvement of library service rather than any reduction of library cost. A written collection development policy facilitates a consistent and balanced growth of library resources, and a dynamic policy is one that evolves as the institution grows. Such as policy is based on the understanding of the needs of the community it serves and seeks to define and limit the goals and objectives of the institution. A collection

development statement is not a substitute for books selection; it charts the forest but does not plant the trees. It should be used as a guidepost, not a crutch. Book selection requires judgement and the courage to choose. A sound collection development policy, on the other hand, provides the necessary rationale without which a collection may grow amoebalike, by means of pseudopodia.

abstract: A print on demand of this book can be obtained by sending e-mail to digital@cornell.edu. In the body of the message include the identifier.uri listed above, and ask to be contacted regarding payment.This is

the story of a country boy raised on a dairy farm in Gilead, CT who, like many others, was caught up in the struggle to stop the onslaught led by the tyrannical dictators who started World War II. It is a story of how the horrors of war and the experience with the brave, bright, loyal Americans of Japanese ancestry taught me a great deal about the meaning of life -- a meaning that I will seek forever to appreciate more fully.
Many of these young men and their families were literally torn from their homes, loaded into trucks and shipped off to concentration camps. Can you imagine what it was like to be an innocent American deprived of your rights of citizenship? Yet they volunteered and formed the most distinguished, most decorated army unit in the history of the United States. These young Nisei men had three objects in mind: 1) work together as a team, 2) get the damn war over, and 3) go home and take care of their families. Unfortunately, many gave their last full measure of devotion on the blood-stained battlefields of World War II. I know. I was there.

title: Contextual Mediators between Adolescent Sexuality and Negative Outcomes
abstract: These three papers form an argument that youths? sexual behavior and sexual-minority orientation are associated with negative outcomes of alcohol use, depression, and suicide via negative changes in perceived contextual support. They employ data from the first two waves of the National Longitudinal Survey of Adolescent Health (collected 1995 & 1996, Wave I N = 18,924, Wave II N = 13,570, http://www.cpc.unc.edu/projects/addhealth).
The first paper demonstrates reciprocal effects over one year between adolescent sexual activity and shared activities with opposite-sex parents, closeness with same-sex parents, and more problem-focused interactions with both parents. The second paper finds that initiating or continuing sexual activity predicts reduced integration with the school environment, increased number of close friends who use alcohol, and increased problem-focused interactions with parents. It is additionally associated with lower personal religiousness for young women only. The second paper finds further that ceasing sexual activity did not forestall negative changes in contextual supports, as the first paper?s results implied, but rather that negative changes continued. The second paper also finds that levels of context factors significantly mediate the relationship between sexual

activity and each of depression, suicidality, and alcohol use.
The third paper, using only Wave I data, applies the first two papers? contextual mediation concept to explain mental health risks associated with same-sex, both sex, and opposite-sex romantic attraction, dating, and sexual behavior. After testing every combination of subject?s gender, object?s gender, and domain of expression for associations with depression and suicidality, the third paper finds several patterns ? sexually/romantically active female, sexual-minority, and non-virgin ? consistently associated with depression and suicidality. These patterns are suggested to be associated with risk because they impart stigmatized status to youth that impedes their access to needed social supports.
A theoretical model is advanced asserting that stigmatization of youth sexuality leads to both mental health risk and greater likelihood of risk behavior, the latter of which leads to even greater stigmatization and even greater likelihood of risk behavior. This model suggests that increasing support for non-virgin and sexual-minority youth and decreasing stigmatization of them would be most helpful approach for their health.

title: Information quantity, information consistency, and the confidence of unsophisticated investors
abstract: Special committee members include Mark W. Nelson (chair), Robert Bloomfield (Accounting), David Dunning (Social Psychology), and Martin Wells (Statistics).Advances in technology, as well as regulatory and legislative actions (e.g., Regulation Fair Disclosure, Sarbanes-Oxley, new NYSE and NASDAQ requirements) have led to an increase in the quantity of information available to the public. In this dissertation, I describe two experiments that examine the effects of information quantity and consistency (holding information quality constant) on the judgments and trading behavior of unsophisticated investors. I find that increasing the quantity and the consistency of information causes unsophisticated investors to show greater confidence and trading aggressiveness. This relation is not explained by an increase in cognitive effort, suggesting a direct effect of information quantity on confidence. The effect of increased quantity reduces investors' expected and actual wealth in simulated experimental markets, while the effect of consistency on wealth depends on whether the additional, low-quality signals are consistent or inconsistent with the high-quality signal investors receive. Results highlight possible negative consequences of increased disclosure, and suggest directions for future experimental and archival research.Johnson Graduate School of Management at Cornell University, Deloitte & Touche Foundation

title: Peaking of Oil Production: Impacts, Mitigation, & Risk Management
abstract: The peaking of world oil production presents the U.S. and the world with an unprecedented risk management problem. As peaking is approached, liquid fuel prices and price volatility will increase dramatically, and, without timely mitigation, the economic, social, and political costs will be unprecedented. Viable mitigation options exist on both the supply and demand sides, but to have substantial impact, they must be initiated more than a decade in advance of peaking. This U.S. Department of Energy funded paper reports the problem of the peaking of world conventional oil production is unlike any yet faced by modern industrial society. The challenges and uncertainties need to be much better understood. Technologies exist to mitigate the problem. Timely, aggressive risk management will be essential.United States. Department of Energy

title: Using Controlled Vocabularies to Manage Resource Relationships: The KMODDL Experience
abstract: The Kinematic Models for Design Digital Library (KMODDL) exemplifies digital collections in which groups of objects are versions of the same resource and which resources are related to one another taxonomically. Other objects in the collection are supplementary materials that explicitly cite the primary KMODDL resources. To manage the complex relationships among KMODDL objects while maintaining the DC one-to-one principle, metadata developers established controlled vocabulary encoding schemes that linked related objects. The solution implemented enables users to find all versions of a resource and all supplementary materials that cite the resource in a single search.

title: The 42 Month War: Bayou Steel and the USWA's Coordinated Campaign

abstract: Dr. Lowell Turner - Committee Chairperson
Dr. Ileen Devault - Committee MemberThis thesis examines how coordinated campaigns, conducted by labor organizations, affect strike outcomes. Recent changes in the industrial relations environment have forced unions to find new ways to exert pressure on employers beyond tradition collective bargaining and, in the event of impasse, withholding their labor. Many believe that corporate campaigns have the potential to change the ways labor struggles are waged and their results. These campaigns are characterized by diversity, but past ones have included actions targeted at the company?s owners, creditors, customers, and suppliers. Others have focused on the firm?s health, safety, or environmental record with the hope of compelling them to sign a favorable contract.
This thesis examines the literature available on bargaining and strikes, includes brief case studies of several corporate campaigns and the USWA?s experiences with them, and forms an argument based on the evidence. It is proposed that a well-planned corporate campaign will lead to union victories in strikes or lockouts.
The evidence used to test this statement is a detailed case study of the Steelworkers? 42 month coordinated campaign at Bayou Steel. This thesis finds that although the union waged an almost ideal campaign, they did not win the strike. Instead, it was only a partial victory. This is attributed to the fact that the USWA?s campaign, while extensive, was unable to influence the company's ability to make money to the necessary degree.United Steelworkers of America

title: Starch-Polycaprolactone Nanocomposites From Reactive Extrusion: Synthesis, Characterization, Properties And Scale-up Considerations
abstract: Biodegradable starch-polyester polymer composites are useful in many applications ranging from numerous packaging end-uses to tissue engineering. However the amount of starch that can form composites with polyesters without significant property deterioration is typically less than 25% because of thermodynamic incompatibility between the two polymers. A reactive extrusion process was developed in which approximately 60% by weight of plasticized starch was blended with a biodegradable polyester (polycaprolactone, PCL) resulting in tough nanocomposite blends with elongational properties approaching that of 100% PCL. During the extrusion process, starch was cross-linked with polycaprolactone in the presence of hydrogen peroxide and montmorillonite (MMT) organoclay, thus compatibilizing the two polymers.
The objectives of this study were to evaluate the mechanical properties of reactively extruded starch-PCL nanocomposite blends, study changes in the morphology of polymer-polymer interface, monitor dispersion of organoclay in the polymer matrix, quantify the effects of reactive extrusion on polymer glass transition, develop a rheological model and scale up the reactive extrusion process from a batch type micro-extruder to continuous twin-screw extruder.
Starch and PCL (36-39 wt% each), glycerol (18-19 wt%), MMT organoclay (3-9 wt%), hydrogen peroxide (0.067 ml/g starch) and ferrous sulfate catalyst (0.0025 g/g starch) were extruded in a co-rotating twin-screw extruder at 120 C and injection molded at 150 C. Elongational properties of reactively extruded starch-PCL nanocomposite blends approached that of 100% PCL at 3 and 6 wt% organoclay. Strength and modulus remained the same as starch-PCL composites prepared from simple physical mixing (non-reactive extrusion). X-ray diffraction results showed mainly intercalated flocculated behavior of clay at 3, 6, and 9 wt% organoclay. Scanning electron microscopy (SEM) showed that there was improved starch-PCL interfacial adhesion in reactively extruded blends than in non-reactive starch-PCL composites. Dynamic mechanical analysis showed changes in primary alpha- transition temperatures for both the starch and PCL fractions, reflecting cross-linking changes in the nanocomposite blends at different organoclay content. Starch-PCL reactive blends were more pseudoplastic than 100% PCL and showed typical shear-thinning behavior and lower shear viscosities than non-reactive starch-PCL composites. Results from scale-up studies indicated that screw configuration, screw speed and feed rates were important process variables that affected material properties. These were optimized to obtain mechanical properties equivalent to those from the micro-extruder.

title: ONSTRUCTING THE NEW CITIZENSHIP THROUGH THE MUNICIPAL COUNCIL FOR THE DEVELOPMENT AND PARTICIPATION OF THE BLACK COMMUNITY IN CAMPINAS, BRAZIL
abstract: This thesis examines contemporary racial politics and constructions of citizenship in the Municipal Council for the Development and Participation of the Black Community in Campinas, S?o Paulo, Brazil. The central questions of the study are: (1) in relation to citizenship, how have Afro-Brazilian organizations, social movements, and other institutions framed the issues that are affecting the Black community, and what solutions/processes are they suggesting to deal with them? (2) What kind of dialogue/interaction have Council efforts produced between groups in society and the municipal government and how has this contributed to a discourse of ?new citizenship? for Afro-Brazilians? And (3) how can analyzing Afro-Brazilian politics of identity through a framework of citizenship help interpret struggles over identity in relation to the Councils?

A study of the Council illuminates what types of organizations are involved in the process of redefining representation in an urban context and the difficulties being negotiated in constituting both Afro-Brazilian political identity and institutionalizing new state spaces for citizenship in municipal administrations. The process of deliberation is constituted by historical formations of race relations as well as by both present power relations within the Council between representatives, and those between the Black movement and the local government more broadly. The case of the Council allows the tension filled terrain and negotiation of these hegemonic relations to be understood through political practices intended to increase citizen participation and voice. The experiences and impressions of Council processes provide insight into how individual participants situate themselves and how they understand democratic participation and identity formation in relation to the Black community.

The main goal of the Council is to advance racial equality through the valorization, affirmation, and development of Black community. They orchestrate activities in the areas of education, health, culture, and preservation of patrimony, as well as creating channels for public expression of Afro-Brazilian culture and public protests to bring attention to issues they confront. An examination of the Council indicates both the difficulty of creating an understanding of the racial theme as it affects individuals in varied and complex ways, as well as the complexity of constructing a unified identity politics based on race in a context where race has not constituted a primary form of identification and where Black culture and community are diverse.

title: The Empty Object Construction and related phenomena
abstract: This thesis treats a series of constructions containing unexpressed arguments that exhibit traits of null pronouns, but that resist analysis as standard null pronouns. The Norwegian Empty Object Construction (EOC) combines a complete clause with a conjunct that contains an unexpressed object. The fact that this object receives an E-type reading when associated with a quantified NP forces the conclusion that it is indeed a null pronoun. It cannot be considered a standard null pronoun, however, since it cannot occur outside of a non-initial conjunct and is constrained in its reference. The Baule Empty Subject Construction (ESC), elsewhere called a Serial Verb Construction, is shown to be a covert clausal coordination involving a non-initial conjunct containing unexpressed arguments demonstrating these same characteristics. Additionally, in both EOC and ESC the conjuncts must match in polarity and in Tense/Aspect/Mode marking. Adverbial modification of the non-initial conjunct is limited. Unexpressed arguments are barred from sentential complements and from conjuncts with overt subjects. The characteristics of EOC/ESC are shown to be captured by an account under which the unexpressed arguments are null pronouns licensed by reference recovery via an interpretational procedure, the Coupling Mechanism. The Coupling Mechanism uses an antecedent clause to derive a definite description constrained to pick out a unique discourse referent. A null pronoun must occupy a maximal position in its clause in order to access the necessary antecedent clause. The account is shown, with slight modification, to apply to the Dutch/German SLF construction, a construction in which a nominal that is not sentence initial serves as the subject of two clausal conjuncts. It is argued that, alongside the more standardly assumed adjunction structure, SLF can be based on a coordination structure in which the unexpressed subject of the second conjunct is a null pronoun licensed by the Coupling Mechanism. The account is also extended to a case of an unexpressed argument in an adjunct, the Dutch/German Adjunct Object Gap (AOG), commonly analyzed in the literature as a parasitic gap. Under the alternate account proposed here, the AOG is a bound null pronoun licensed by the Coupling Mechanism.

title: More Other Homes and Garbage: Designs for Self-sufficient Living
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment. Population growth, resource depletion, unstable ecosystems, and economic strains are some of the interlinked and uncertain hazards that deteriorate the life experiences of people. Conservation of resources and greater reliance on renewable energy systems sized to the home and perhaps even constructed by the homeowner can provide part of the solution. This book, written by engineers but accessible to anyone with a good calculator, shows how to design and manage technologies that are small-scale, decentralized, conservative, and environmentally gentle.

title: Risk perception and communication about agricultural biotechnology in developing countries: The case of Bt eggplant in India
abstract: Several researchers - most notably Lennart Sjoberg and his colleagues - have proposed that the moral aspects of risk provide a better explanation and prediction of risk perception than the psychometric or cultural model, neither of which accounts for moral concerns. This study is possibly the first to empirically assess if the moral, psychometric and cultural models can explain risk perception of agricultural biotechnology by end users in a developing country. To answer the research question, a scenario was used to elicit perceptions of transgenic Bt (Bacillus thuringiensis) eggplant among 100 eggplant farmers in Maharashtra and 30 eggplant farmers in Tamil Nadu in India. The data suggest that economic benefits, safety concerns, and accountability are most salient to the risk perception of farmer end-users in India. None of the farmers objected to Bt eggplant on moral grounds. Nonetheless, their responses revealed a small number of alternative conceptualizations of morality. This study concludes by suggesting that the psychometric, cultural, and moral models do not account for the risk perception of farmers in India. It proposes that any theory or model that purports to explain and predict risk perception of agricultural biotechnology in the developing world may need to include economic benefits, safety concerns and accountability as key variables.Agricultural Biotechnology Support Project 2 (United States Agency for International Development)

title: New Concepts of Cattle Growth
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment.The concepts in this book about growth and development of cattle are as new now to most cattle producers and even to many animal scientists as they were when it was first published in 1976. Genetic effects - represented

by breed and sex differences - on patterns of growth of muscle, fat, and bone are graphically presented to provide a vivid elucidation of the effect of mature size on changes in body composition with increasing weight. A comprehensive analysis of muscle dissection data shows that historical attempts to select animals for improved muscle distribution, at least as represented by differences among breeds as diverse as Holstein and Hereford, have been futile. Other effects, such as nutrition, on growth of muscle, bone, and fat are covered, and the effectiveness of indirect methods of predicting carcass composition are summarized. This book is an essential component of the reference collections of agricultural scientists and livestock farmers who rely on data to make decisions about the value of animals for meat.

title: Contested Values: Democracy and Diversity in American Culture
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment.Because of their diversity, Americans have differed historically about the optimal way to achieve democratic goals in their society and culture. How can the reform impulse best be realized, for example. Temperance? Birth control? Teaching evolution? The merits of internationalism versus isolation? Environmentalism? Improving race relations and the role of women in the workplace? Disagreements have been overcome even as new ones emerge. What results is an on-going dialogue about the quality and character of American culture itself. Ultimately, that dialogue has been about conflicting and competing values.

title: Simulated Mean Annual and Extreme Event Runoff Loads of Herbicides Commonly Used in Urban Areas Throughout the United States
abstract: The runoff of thirty turf herbicides commonly used on lawns, parks, and golf course fairways and greens throughout the United States was simulated using the TurfPQ model. The model was used to obtain ninety nine years of daily water input, water runoff, and herbicide runoff for ten locations: Boston, MA, Charlotte, NC, Denver, CO, Houston, TX, Indianapolis, IN, Jacksonville, FL, Los Angeles, CA, Minneapolis, MN, Portland, OR, and Wichita, KS. Results were summarized as mean annual herbicide runoff loads (g/ha), extreme event herbicide runoff loads corresponding to a 20 year return period (g/ha), mean herbicide runoff as a percentage of annual application, extreme event herbicide runoff as a percentage of annual application, mean annual water input (mm), and mean annual water runoff (mm). Urban areas that produced the highest herbicide runoff loads based on surface runoff were Boston, Charlotte, Houston, Indianapolis, and Jacksonville. Mean annual runoff loads did not surpass 3.4% of the annual herbicide application with most instances considerably less than 1%. Extreme event runoff loads did not surpass 9% of the annual herbicide application but were highly variable and appear to have been very dependent on both location and herbicide. The runoff loads of atrazine, bensulide, DSMA, ethofumesate, napropamide, pendimethalin, and siduron were the largest per hectare. Siduron has the most massive runoff load, which is mainly due to the large amount of the herbicide that is applied annually. Herbicides whose runoff loads contained 3.5% or more of the applied annual amount in one or more simulated event include 2,4-D, atrazine, bentazon, dicamba, ethofumesate, halosulfuron, imazaquin, MCPA, MCPP, quinclorac, siduron, simazine, and triclopyr. These herbicides have the most potential for surface runoff in extreme events. A common factor for these herbicides was low organic carbon partition coefficient values.

title: Image Processing Using Sensor Noise and Human Visual System Models
abstract: Because digital images are subject to noise in the device that captured them and the human visual system (HVS) that observes them, it is important to consider accurate models for noise and the HVS in the design of image processing methods. In this thesis, CMOS image sensor noise is characterized, the chromatic adaptation theories are reviewed, and new image processing algorithms that address these noise and HVS models are presented.
First, a method for removing additive, multiplicative, and mixed noise from an image is developed. An image patch from an ideal image is modeled as a linear combination of image patches from the noisy image. This image model is fit to the image data in the total least square (TLS) sense, because it allows uncertainties in the measured data. The image quality of the output image demonstrates the effectiveness of the TLS algorithms and improvement over existing methods.
Second, we develop a novel technique to combine demosaicing and denoising procedures systematically into a single operation. We first design a filter as optimally estimating a pixel value from a noisy single-color image. With additional constraints, we show that the same filter coefficients are appropriate for demosaicing noisy sensor data. The proposed technique can combine many existing denoising algorithms with the demosaicing operation. The algorithm is tested with pseudo-random noise and noisy raw sensor data from a real digital camera, and the proposed method suppresses CMOS image sensor noise while effectively interpolating the missing pixel components better than when treating demosaicing and denoising problems independently.
Third, the problem of adjusting the color to match the digital camera output with the scene observed by the photographer?s eye is called white-balance. While most existing white-balance algorithms combine the von Kries coefficient law and an illuminant estimation techniques, the coefficient law has been shown to be an inaccurate model. We instead formulate the problem using induced opponent response theory, the solution to which reduces to a single matrix multiplication. The experimental results verify that this approach yields more natural images than traditional methods. The computational cost of the proposed method is virtually zero.Texas Instruments, Agilent Technologies, Center for Electronic Imaging Systems

title: Growth, Architecture, Cell Separation, Electrophysiology and Sucrose Transport of Ripening Rice Caryopses
abstract: Roger M. Spanswick, Susan R. McCouch, Larry P. WalkerRice (Oryza sativa L.) life cycle and yield depend on the partitioning of assimilated carbon to ripening caryopses. Structural and functional aspects of this important process were investigated. First, spatiotemporal dynamics of ripening were assessed. Panicle fresh weight accumulation was maximum after three weeks and had a maximum rate after twelve days. Panicle architecture and ripening asynchrony were reduced to the form of an annotated panicle array. This format permitted a quantitative, computational approach to panicle consensus generation, data analysis and graphical display. Next, the separability of caryopsis tissues was assessed. The caryopsis coat was mechanically isolated from most of the embryonic tissues and facially separated into outer and inner coats from within the tube cell layer. Pectolyase Y-23 compromised adhesion between the maternal nucellus and embryonic aleurone and between endosperm cells. Viable protoplasts were prepared from approximately 10% of the isolated endosperm cells. Low protoplast yield was correlated with low viability of the isolated cells. Third, the mechanism of sucrose uptake by the aleurone was studied. The sucrose concentration-dependence of uptake rate had a nonsaturable component and a relatively small saturable component. Finally, electrophysiology of the caryopsis coat was assessed. Membrane potentials of the aleurone and nucellus were approximately -60

mV and -80 mV, respectively, and invariable over a range of bath conditions. Sucrose negligibly depolarized the aleurone membrane potential. Thus, it was not possible to confirm that the saturable sucrose influx was mediated by a cotransport system. Overall, the work has increased the experimental accessibility of ripening panicles and caryopses for research on the control of carbon partitioning.Department of Biomedical Sciences, Department of Plant Biology

title: Throughput Stability and Flows in Large-Scale Random Networks
abstract: Sergio D. Servetto, Eva TardosThe rate of growth of the maximum stable throughput in large-scale random networks as a function of network size is studied in this thesis. The problem is formulated as one of determining the value of the maximum multicommodity flow on the corresponding random unit-disk graph and shown to be equivalent. In this way, using simple flow techniques and probability tools, a tight bound is derived on the rate of growth of the maximum stable throughput with a fairness constraint. As an application of these techniques, similar bounds are computed for different cases of highly dense wireless networks when directional antennas are being used and the results are compared to the omnidirectional case.National Science Foundation

title: Courting Serendipity: The Search for Transient Radio Signals
abstract: The transient radio sky remains a frontier of observational astronomy, not for lack of scientific promise, but for practical obstacles: terrestrial radio frequency interference (RFI) and limited computing power. Today, a confluence of new RFI mitigation techniques and computing power makes a thorough census of the radio sky a realistic goal. A complete transient survey could uncover, in addition to entirely new classes of sources, radio sources that have been predicted but never observed. These sources include pulses from primordial black hole explosions and prompt emission associated with gamma ray bursts. A search could also reveal extreme-period pulsars or giant-pulsing extragalactic pulsars. Here we present three transient-seeking algorithms suitable for processing large data sets. General statistics regarding the algorithms' performance on simulated data are presented, as well their performance on data from the Crab Pulsar and the galaxy UGC 2339.
We also present results of a search for cyclotron maser emission from extrasolar planets. Extrasolar planets are likely emitters of non-thermal radio emission analogous to the bursting radio emission observed from all five of our solar system's magnetized planets. Four planetary systems were observed at the Arecibo Observatory. In 15 hours of 327 MHz observations made over the course of nine days in July, 2004, no detections were made.National Science Foundation

title: A QUANTITATIVE THERMAL IMAGING TECHNIQUE TO EXTRACT A CROSS-STREAM SURFACE VELOCITY PROFILE FROM A FLOWING BODY OF WATER
abstract: Committee Chairperson: Prof. Edwin A. Cowen
Committee Member: Prof. Tammo SteenhuisThe United States Geological Survey (USGS) is responsible for monitoring river flow rates at over 7,000 locations across the United States. This operation is expensive, inefficient, and often dangerous, as USGS personnel must deploy direct in-the-field measurement equipment to obtain the required flow data during storm events. An affordable, remote, non-contact sensor that is capable of determining river flow rates under a variety of flow environments is, therefore, highly desired by the USGS and other agencies worldwide charged with the task of water flow monitoring and management.
A technique is presented in which a cross-stream surface velocity profile is extracted from a series of thermal infrared images of a flowing water surface. Analytical methods and algorithms are borrowed from Quantitative Imaging (QI) fields such as Particle Image Velocimetry (PIV) and Particle Tracking Velocimetry (PTV), and are adapted for use on the thermographic image set. Monte Carlo Simulations are used to compare several iterative improvements to the initial correlation-based displacement algorithm. Particular emphasis

is placed upon extracting reliable results from images with a very low signal-to-noise ratio (SNR) typical of the image type recorded by an inexpensive thermal imaging system in the nearly uniform temperature environment of interest.

Laboratory experiments are used to verify the capacity of the altered displacement algorithm to extract cross-stream velocity profiles from thermal images recorded from above an open-channel flume. Several cases ranging from high to low SNR are studied. The displacement algorithm's analysis of the high SNR data sets provides a velocity profile that agrees with the profile measured by an Acoustic Doppler Velocimeter (ADV). Displacement results for the medium and low SNR cases required further processing after the initial displacement algorithm analysis. A qualitative analysis of the post-processed data reveals that a deterministic signal can be extracted from such noisy image sets, and further refinements of the displacement algorithms to accomplish these tasks are possible.National Science Foundation?s Small Grant for Exploratory Research (SGER) program (grant no. title: REASSESSMENT OF A GANGLIOSIDE-LIPOSOME BIOSENSOR
abstract: Botulism, the disease caused by the introduction of botulinum toxin (BT) into the body, is a rare but severe ailment that frequently results in death from respiratory failure. Cholera, the disease caused by the introduction of cholera toxin (CT) into the body, is a much more common problem in third world countries, causing severe diarrhea and dehydration.
In this study, the design of previously developed sensitive biosensors for the detection of BT and CT has been scrutinized, with the intention of improving upon the detection limit the BT assay. This biosensor is a test strip assay which utilizes ganglioside-incorporated liposomes, and toxin antibodies which are immobilized on an analytical zone of a plastic-backed nitrocellulose membrane strip to form a sandwich-type detection mechanism. The intensity of the band could be visually estimated or measured by densitometry, using computer software. Previous studies with this design obtained a limit of detection (LoD) of 15 pg/mL and 10 fg/mL in 20 minutes for BT and CT, respectively. Difficulties in obtaining any concentration gradient in the detection of BT, converted this study into a reassessment of this prior design. All attempts to obtain a BT biosensor similar to that developed in the previous study failed to obtain a LoD greater than 10 ?g/mL, and took at least 35 minutes to complete. A similar attempt to recreate the CT biosensor design yielded a LoD no greater than 0.64 ng/mL, but took only 15-20 minutes to complete. The results from this study suggest that the design of the bioassay developed for BT should be reconsidered, and that further studies should be undertaken to consider alternative approaches to this assay.

title: DESIGN AND OPTIMIZATION OF A BIOSENSOR FOR THE DETECTION AND QUANTIFICATION OF T-LYMPHOCYTES
abstract: In health care, cell enumeration by immunophenotyping has been crucial in diagnosing and treating patients with HIV, leukemia, or bone marrow transplantation. One key use of immunophenotyping is for detection of HIV. The increase in the number of HIV in blood leads to a significant drop in one subset of leukocyte, the T helper cells (CD4 cells), in the patient?s blood. Detection and quantification of CD4 cells are thus important measures for the indication of HIV infection. Many immunophenotyping techniques have been developed in the past but the flow cytometry has stood out as the golden standard. Flow cytometric immunophenotyping uses the receptor proteins present on the T-helper cells, CD3, CD4, and CD45 for quantification. This technique, however, is very costly and not affordable to all health care sectors.
This project investigates a design and optimization of a biosensor that quantifies the amount of T-lymphocytes in human blood. Quantification of T lymphocytes is useful as a positive control in the case of HIV detection and as a determinant of immunological status of the patient during immunosuppressive therapy. A microfluidic biosensor based on liposome signal generation and amplification is adapted to the detection of the T-lymphocytes using two specific sets of antibodies recognizing CD3 and CD45 proteins on the surface of the cells.
This microfluidic biosensor utilizes superparamagnetic beads tagged with CD45 antibody as capture probe and sulforhodamine B entrapping immunoliposomes tagged with CD3 antibody as reporter probe. The assay condition is optimized for the running buffer composition and the flow time resulting in assay times of approximately 10 minutes. Non-specific interactions of the liposomes and beads are measured and reduced by approximately 30% using a blocking solution. The non-specific interactions of the red blood cells are reduced by lysing the red blood cell prior to testing. A dose response curve of varying human blood concentrations is created to show the correlation of the signal with respect to different concentrations of cells. The limit of detection is determined to be 80-220 T-lymphocytes.
The micro-biosensor is designed to be a simple and easy to use device that can be manufactured and operated at low cost and was thus applicable for testing in resource-limited settings. It has a great potential as a tool for detection and quantification of T-lymphocytes since it uses the same biological recognition principles as used in flow cytometry, however, its simplicity and low cost make it an attractive alternative .

title: An Analysis of the Consumption Demand Data on The DLA's Lead-time Forecast Accuracy
abstract: The Defense Logistics Agency generates forecasts for demand from military service warehouses (wholesale demand) using a double exponential smoothing (DES) forecasting model. However, the Agency will be moving to a Fourier forecasting model, which explicitly accounts for seasonality in demand data. We found that obtaining additional demand data from the military maintenance centers (consumption demand) will improve lead-time forecast accuracy in both forecasting models. In addition, we found that different incorporations of the consumption demand data are needed depending on the accuracy metric utilized. LMI AND THE DLA WEAPON SYSTEM SUSTAINMENT PROGRAM

title: Studies Involving the Effect of Organic Solvents on Liposome-based Lateral-flow and Silica-coated Magnetic Bead Assays
abstract: The ubiquitous threat of Escherichia coli (E. coli) O157:H7 as an enterohemorrhagic pathogen to humans has challenged scientists worldwide to develop a biosensor that would accurately and efficiently detect the bacteria in the environment. This research involved modifications made to the liposome-based RNA biosensor developed in Baeumner et al., 2003. The goal was to investigate the effect of alcohols on the lateral-flow assay with the ultimate objective of developing a silica-coated magnetic bead biosensor based on integrated RNA isolation and detection. Both isolation and detection are carried out in the presence of 40 % ethanol, which immobilizes RNA onto silica. Detection is done through hybridization between the target RNA, reporter probe and dye-encapsulating liposome. If successful, this biosensor would be able to isolate E. coli O157:H7 mRNA for the heat shock gene and detect for viable bacteria in one step. The project was thus divided into two segments: The effect of ethanol on the lateral-flow biosensor assay was first investigated, after which the principle of bead assay was studied. Interestingly, it was found that 33 % ethanol in the hybridization buffer and 20 % ethanol in the running buffer created conditions in the lateral-flow assay that increased the overall signal to noise ratio from 1.46 to 3.66, or 2.5 times, when 50 fmol target sequence was used. Further investigations with other target analytes and over a broader range of target concentrations are needed, and will likely lead to an improved standard lateral-flow assay with significantly lowered limits of detection. Secondly, the principle of the integrated RNA isolation and detection bead-assay was proven, and the amount of background RNA and silica-coated magnetic beads optimized. However, the signals obtained were affected negatively by very high background noise and high standard deviations. A great deal of research into this type of assay is still needed in order to transform it into a viable assay.

title: Open Scholarship and Research Universities
abstract: Compare the cost per article for publication in commercial journals, not-profit journals, and open-access journals. For universities that support open-archives and open-access journal management software

as part of standard university infrastructure, the financial cost of hosting an additional journal is quite low. Scholars who commit to editing and promoting a journal need to focus primarily on the intellectual tasks with little concern for finances.

title: Immigrants and the Community: Farmworkers with Families
abstract: Second in a series based on the research project ?Integrating the Needs of Immigrant Workers and Rural Communities,? which attempts to inform New York communities about the nature and consequences of increasing immigrant settlement.America's hired farm workforce has changed considerably in the last decade. The most apparent change has been its "latinization" during the past two decades. This is largely a consequence of large numbers of Mexicans coming to the United States to work. Although Mexican immigrants work in numerous industries across the American landscape, they are especially important in agriculture. There has been a growing tendency of farmworkers to settle in rural communities together with their immediate family. But how and to what extent does community integration occur? How do foreigners who have little familiarity with American culture become integrated into the community? Answers to these questions have practical importance to farmers interested in retaining their workforce, service providers working to improve farmworker well-being and communities interested in helping the new residents contribute to community development. To help us understand the factors that both promote and limit the integration of immigrants into rural communities, we chose for study five New York agricultural communities in different economic and social contexts that have relied heavily on hired farm labor. Each community has a minority population of some significance and a history of immigrant farmworkers settling there.

title: MOLECULAR AND GENETIC INVESTIGATIONS OF ALUMINUM TOLERANCE IN WHEAT (TRITICUM AESTIVUM) AND MAIZE (ZEA MAYS)
abstract: Aluminum (Al) toxicity is the primary limiting factor of crop production on acid soils, which affect much of the earth's arable lands. Traditional plant breeding has been successful in improving crop tolerance to Al toxicity. However, further improvements in crop aluminum tolerance will require a deeper understanding of the underlying molecular and physiological mechanisms. Hence, the research described in this thesis focused on the genetic and molecular basis for aluminum tolerance in wheat and maize.
In wheat, two approaches were taken to attempt to isolate Al tolerance genes/proteins. A proteomics-based approach using wheat deletion lines around the major Al tolerance locus was unsuccessful in identifying Al tolerance proteins associated with tolerance. An alternate approach focused on the isolation of putative malate transporters of the CLC (chloride channel) channel family, as wheat Al tolerance is based on Al-activated root malate exudation. Eight representatives of this family were cloned from the Al tolerant wheat cultivar Atlas 66; however, genetic analysis revealed that none of these genes were linked to the wheat Al tolerance locus. The CLC genes exhibit widely different tissue and Al responsive gene expression patterns, suggesting different functions for some of these CLCs. Phylogenetic analysis revealed that the cloned TaCLCs represent only a portion of the entire CLC family present in wheat. In maize, a quantitative statistical analysis of aluminum tolerance was conducted on recombinant inbred lines of the intermated B73 x Mo17 (IBM) population. Five quantitative trait loci (QTL) were identified using composite interval mapping as having a significant impact on Al tolerance. These five regions were not orthologous to genomic regions associated with Al tolerance in wheat, rice, sorghum, rye, or barley. In three QTL, Mo17, which has an extremely high Al-activated root citrate release, contributes the superior allele, and these QTL are likely to contribute to that mechanism. In the two QTL in which B73, which has virtually no citrate release, contributes the superior allele tolerance is likely conferred through an alternative mechanism.

title: The (Semi-)Classical Vibrational Echo
abstract: The ultrafast vibrational echo experiment is one of a modern generation of nonlinear coherent optical spectroscopies probing the nuclear dynamics of condensed phases. The vibrational echo is the vibrational analog of the NMR spin echo and selectively eliminates inhomogeneous broadening from the echo spectrum, providing direct information about the timescale of dynamics within a sample. Echo experiments performed by the Fayer group at Stanford University on carbonmonoxy myoglobin discriminate between the dynamic lineshapes of the A states of MbCO. By performing classical molecular dynamics simulations and using nonlinear optical response theory, we have identified the microscopic origins of these states based upon agreement between the experimental vibrational echo decays of the states and echo decays calculated for two distinct structures observed within simulation. We have analysed the properties of the vibrational echo response within the framework of classical mechanics. We have discovered that van Kampen's objection to nonlinear response theory is particularly significant in classical mechanics, where we have shown that the classical echo response function describing the experimental signal diverges in time for a thermal ensemble of noninteracting anharmonic oscillators. We have interpreted the dephasing and rephasing of the vibrational echo experiment in terms of a classical picture which also identifies the classical analogs of quantum mechanical double-sided Feynman diagrams. We have investigated the role of resonant coupling on the quantum mechanical vibrational echo at zero temperature and have analytically taken the classical limit of this expression to investigate the effect of resonance on classical echoes. Finally, we have developed a formalism for utilising the semiclassical Herman-Kluk propagator in the calculation of nonlinear response functions. Applying this formalism we have demonstrated that, for a thermal ensemble of non-interacting Morse oscillators, nearly quantitatively exact approximations to the quantum mechanical vibrational echo signal may be calculated using classical trajectories.NSF - graduate research fellowship, NSF - IGERT fellowship (Grant DGE-9870681), NSF CHE-0105623, NSF CHE-0413992, petroleum research fund of the American Chemical Society

title: Electron Transport Through Nanoscopic Structures
abstract: This doctoral dissertation is concerned with modeling electron transport through nanoscopic structures, such as quantum dots, metal particles, or molecules.

In Chapter 2, we consider statistical correlations between the heights of conductance peaks corresponding to two different levels in a Coulomb-blockaded quantum dot. Correlations exist for two peaks at the same magnetic field if the field does not fully break time-reversal symmetry as well as for peaks at different values of a magnetic field that fully breaks time-reversal symmetry.

In Chapter 3, we present a density-matrix rate-equation approach to sequential tunneling through a metal particle weakly coupled to ferromagnetic leads. Our formalism is valid for an arbitrary number of electrons on the dot, for an arbitrary angle between the polarization directions of the leads, and with or without spin-orbit scattering on the metal particle. Interestingly, we find that the density-matrix description may be necessary even for metal particles with unpolarized leads if three or more single-electron levels contribute to the transport current and electron-electron interactions in the metal particle are described by the `universal interaction Hamiltonian'.

In Chapters 4 and 5, we consider transport through molecular devices with strong coupling to a single vibrational mode for the case that the vibration is damped by coupling to the environment. We focus on the weak tunneling limit, for which a rate-equation approach is valid. The role of the environment can be characterized by a frequency-dependent frictional damping term and corresponding resonance frequency shift. We calculate current-voltage curves in Chapter 4 and find qualitative agreement between our theory

and recent experiments on C_{60} single-molecule devices. In Chapter 5, we see that, depending on how the characteristic length scales of the van der Waals and electrostatic interaction of the molecule with the environment compare to each other, orthogonality catastrophe may appear or disappear, resulting in a smooth or discontinuous current-voltage curve, respectively.
Finally, in Chapter 6, we investigate the influence of electron-phonon coupling on the current through a metallic single-walled carbon nanotube. In particular, we consider the high-energy optical and zone-boundary phonons and calculate an effective high-bias electron scattering rate, which is close to the experimentally observed value.Support by the Cornell Center for Materials Research (CCMR) under NSF grant no. title: Nutrients in agroecosystems: Rethinking the management paradigm
abstract: Agricultural intensification has greatly increased the productive capacity of agroecosystems, but has had unintended environmental consequences including degradation of soil and water resources, and alteration of biogeochemical cycles. Current nutrient management strategies aim to deliver soluble inorganic nutrients directly to crops and have uncoupled carbon, nitrogen and phosphorus cycles in space and time. As a result, agricultural ecosystems are maintained in a state of nutrient saturation and are inherently leaky because chronic surplus additions of nitrogen and phosphorus are required to meet yield goals. Significant reductions of nutrient surpluses can only be achieved by managing a variety of intrinsic ecosystem processes at multiple scales to re-couple elemental cycles. Rather than focusing solely on soluble, inorganic plant-available pools, an ecosystem-based approach would seek to optimize organic and mineral reservoirs with longer mean residence times that can be accessed through microbially- and plant-mediated processes. Strategic use of varied nutrient sources, including inorganic fertilizers, combined with increases in plant diversity aimed at expanding the functional roles of plants in agroecosystems will help restore desired agroecosystem functions. To develop crops that can thrive in this environment, selection of cultivars and their associated microorganisms that are able to access a range of nutrient pools will be critical. Integrated management of biogeochemical processes that regulate the cycling of nutrients and carbon combined with increased reservoirs more readily retained in the soil will greatly reduce the need for surplus nutrient additions in agriculture.

title: Tips for Evaluating Web Sites
abstract: Presented at the summer meeting of the American Association of Physics Teachers in 2002For better or worse, the web has become an integral part of our lives. As a central repository for information, the web can greatly enrich institutions that have limited resources at their disposal. The good news is that the size of the web is estimated at three-billion documents. That is also the bad news. The sheer size of the monster gives one pause. How can one possibly find relevant information in the morass? More importantly, how can one evaluate the information found? Help is readily available.

title: QUANTITATIVE VISUALIZATION OF CARBON DIOXIDE GAS TRANSFER AT A TURBULENT FREE SURFACE
abstract: Advisor = Edwin A. CowenWe study the aqueous-phase side of the transfer of carbon dioxide gas across an air-water interface. Quantitative imaging techniques are used to directly visualize the physical processes which determine the average gas transfer rate. The interface is a free surface in the absence of mean shear, with turbulence generated on the water side, well away from the free surface, which then transports itself to the free surface. This turbulence is generated far beneath the free surface by an array of upward-pointing synthetic jets which are each driven according to independent random time series. We show that this method of turbulence generation is superior to the traditional grid-stirred tank in that it exhibits weaker mean secondary flows.
Using Laser Induced Fluorescence (LIF) and Particle Image Velocimetry (PIV) we measure simultaneous concentration and velocity fields, respectively. These are measured in planar fields perpendicular to and intersecting the free surface. From these we calculate turbulent statistics of interest. Namely, the vertical profiles of mean and fluctuating velocity magnitudes, momentum dissipation rate, spatial power spectra for velocity and concentration, and the turbulent mass flux.
Examination of the turbulent mass flux field reveals that downward-traveling fluid, which leaves the concentration boundary layer at the surface and enters the bulk, is responsible for the majority of the gas transfer. This is in contrast to the commonly held view that upward-traveling fluid from the bulk dominates gas transfer. The spectrum of the turbulent mass flux field is nearly flat, showing that motions of all sizes in the inertial subrange contribute equally to the mass transfer. This resolves the longstanding question about

which size eddies are responsible for gas transfer.This work was supported by: NSF CAREER Grant CTS-0093794, NSF IGERT Site Grant DGE-9870631, and NSF GK-12 Site Grant 0231913. title: Librarians, Learning, and Creativity: A Boundary-Breaking Perspective
abstract: In the increasingly interconnected world of the Web, in which information seekers want to work self-sufficiently, how can librarians continue to contribute to saving time and advancing the state of knowledge? Taking the Web, dramatic shifts in information-seeking behavior, and technology-driven research, teaching and learning as starting points, Karen Calhoun will suggest a proactive, community-based, collaborative role for libraries and librarians in the online information marketplace of the twenty-first century.
Calhoun's talk, which explores libraries' traditional boundaries and a possible new model for a library's participation in its community, provides a number of examples of strategic choices and actions, including making library collections and services more visible. She concludes with a discussion of the role of the creative workplace and leadership in achieving renewed vision, sustainable change, and ongoing innovation in libraries.

title: Classical and Semiclassical Mechanics of Molecular Rotors in Tilted Fields
abstract: Committee: Greg Ezra (chair), Ben Widom, Roger Loring We investigate the classical mechanics of diatomic and symmetric top molecules in tilted fields. These molecules exhibit regular, chaotic or mixed phase space depending on the tilt angle β, the energy E, and the relative intensity of the fields $\omega/\Delta\omega$. In the integrable collinear problem the projection of the angular momentum into the spatial z axis is a constant of motion, m, which allows us to explore the geometry of the phase space, and to use energy momentum diagrams to classify the motions of the rotor. For $\beta \ne 0$ the system is non-integrable showing mostly regular dynamics in the high-energy (free-rotor) and low-energy (pendular) limits; for energy near the tilted fields barrier the phase space is highly chaotic with degree of chaos increasing with β between 0 and $\pi/2$. Periodic orbits and bifurcation diagrams are obtained from symmetry lines and their iterations under the Poincar\'{e} map. These bifurcation diagrams are used to observe the changes in the basic structure of the phase space as β changes between collinear and perpendicular fields. Some quantum eigenstates are localized near stable or unstable periodic orbits showing tori quantization or scarring respectively.
For asymmetric top molecules only the case of collinear fields is treated. In parallel fields m is a constant of the motion and it is possible to define an effective potential $V_m(\theta,\psi)$. In an E-m diagram the equilibrium solutions of $V_m(\theta,\psi)$ are curves that enclose regions of qualitatively different

accessible θ-ψ configuration space. Interestingly these regions can be used to classify the quantum eigenstates.
For plane rotors primitive semiclassical mechanics is used to calculate the rotational excitation caused by laser pulses. Depending on the pulse intensity and duration several methods are employed from the analytical sudden approximation to primitive semiclassical initial value representation (IVR) integrals. The calculated transition probabilities are in good agreement with the quantum probabilities considering the simplicity of the methods. In the case of plane rotors in electric fields we calculate energy spectra, orientation ($\left<\cos\varphi\right>$), and alignment ($\left<\cos^2\varphi\right>$), using the Herman-Kluk propagator in terms of periodic coherent states. These results are in good agreement with the quantum analogues although the number of trajectories used is discouragingly large. For diatomic rotors in tilted fields, the HK propagator was used to calculate energy spectra with good agreement for high-energy and not very dense eigenspectra. Some steps are taken towards the development of HK-type propagator for rotational coherent states.Cornell University, Department of Chemistry and Chemical Biology

title: Estimating Mixing Times: Techniques and Applications
abstract: How many times do you have to shuffle a deck of n cards before it is close to random? log n? n? n^3? Similar convergence rate questions for finite Markov chains are central to solving applied problems in diverse fields including physics, computer science and biology. This thesis investigates two general techniques for estimating mixing times for finite Markov chains: modified logarithmic Sobolev inequalities and Faber-Krahn inequalities; and analyzes the convergence behavior of a specific family of random walks: the top to bottom shuffles.
Logarithmic Sobolev inequalities are a well-studied technique for estimating convergence rates for Markov chains. In contrast to continuous state spaces, there are several distinct modified log Sobolev inequalities in the discrete setting. Here we derive modified log Sobolev inequalities for several models of random walk, including the random transposition shuffle. These results lead to tight mixing time estimates, and additionally, yield concentration inequalities.
Faber-Krahn inequalities have been used to estimate the rate of decay of the heat kernel on complete, non-compact manifolds and infinite graphs. We develop this technique in the setting of finite Markov chains, proving upper and lower mixing time bounds via the spectral profile. This approach lets us recover previous conductance-based bounds of mixing time, and in general leads to sharper estimates of convergence rates. We apply this method to several models, including groups with moderate growth, the fractal-like Viscek graphs, and the torus, and obtain tight bounds on the corresponding mixing times.
A deck of n cards is shuffled by repeatedly moving the top card to one of the bottom k positions of the deck uniformly at random. We give upper and lower bounds on the total variation mixing time for this shuffle as k ranges from a constant to n. We also consider a symmetric variant of this walk which at each step either inserts the top card randomly into the bottom k positions or moves a random card from the bottom k positions to the top. For this reversible shuffle we derive L^2 mixing time bounds.National Science Foundation grant DMS-0306194

title: The genetics of speciation and the origin of genomic divergence

abstract: Richard Harrison, Charles Aquadro, Amy McCune Speciation involves the origin of trait differences that limit or prevent gene exchange and ultimately results in daughter populations that form monophyletic or exclusive genetic groups. However, for recently diverged populations or species, between which reproductive isolation is often incomplete, gene genealogies will be discordant and most regions of the genome will display nonexclusive genealogical patterns. In these situations, genome regions for which one or both species are exclusive groups may mark the footprint of recent selective sweeps. Alternatively, such regions may include or be closely linked to "speciation genes," genes involved in reproductive isolation. Therefore, comparisons of gene genealogies allow inferences about the genetic architectures of both reproductive isolation and adaptation. Contrasting genealogical relationships in sexually isolated Z and E pheromone strains of the European corn borer moth (ECB) demonstrate the relevance of this approach.
Genealogies for five gene regions in ECB are discordant, and for only one molecular marker, the sex-linked gene Tpi, are the two pheromone strains exclusive groups. A genetic linkage map provides the context for understanding genealogical discordance. The factors responsible for sexual isolation, male behavioral response (Resp) and female pheromone production (Pher), and the factor causing temporal isolation, post-diapause development (Pdd), were placed on a linkage map that also contained the mapping positions of the gene genealogies. Pher maps to an autosome, whereas Resp and Pdd are sex-linked. The exclusive gene, Tpi, maps to a position on the sex chromosome that is indistinguishable from Pdd; Resp maps 20-30 cM away. Neutral demography involving population expansion and population substructure can explain most genetic patterns among loci; however, Tpi shows evidence for non-neutral evolution. Because Tpi is tightly linked to Pdd, recent evolution of this reproductive barrier may be responsible for the evolution of genetic divergence between these incipient species.Graduate School at Cornell University, Department of Ecology and Evolutionary Biology at Cornell University, U.S. Environmental Protection Agency Science to Achieve Results fellowship for graduate environmental study (U-94589501-1), U.S. Department of Agriculture (2001-35302-11123), National Science Foundation (DEB-0415343).

title: The Northern Root-Knot Nematode on Carrot, Lettuce, and Onion in New York
abstract: Root-knot nematodes (Meloidogyne spp.) are major pathogens of vegetables throughout the United States and world, impacting both the quantity and quality of marketable yields. In addition, root-knot nematodes interact with other plant pathogens, resulting in increased damage caused by other diseases. To date, only the northern root-knot nematode (NRKN; Meloidogyne hapla) has been found on vegetables grown on organic or mineral soil in New York, as it is able to survive the extreme low temperatures during winter. The NRKN has a wide host range consisting of more than 550 crop and weed species, including weeds common to muck soils such as dandelion (Taraxacum officinalis), purslane (Portulaca oleracea), mallow (Malva rotundifolia) and plantain (Plantago major). The increasing occurrence and damage of this nematode to onions, lettuce, and carrots grown on organic soils in New York was recently documented.

title: The Fossil Record of Iteaceae and Grossulariaceae in the Cretaceous and Tertiary of the United States and Canada
abstract: Committee: W.L. Crepet, K.C. Nixon, M.A. Luckow, and W.D. AllmonCircumscriptions and the perceived importance of the family Saxifragaceae (Order Saxifragales) in angiosperm evolution have historically been highly mutable. It is only recently, with the advent of phylogenetic techniques employing molecular sequence data, that the content and relationships of the family appear to have stabilized. Saxifragaceae is now thought to consist of ca. 30 genera of herbaceous plants and to form a monophyletic group with the small families Grossulariaceae (Ribes, the currants and gooseberries), Iteaceae (Chorstylis and Itea), and Pterostemonaceae (Pterostemon). The earliest known member of this saxifrage clade, Divisestylus, occurs in Turonian-age (ca. 90 Ma) sediments of New Jersey, USA, and appears?based on both comparative morphological analysis and cladistic analyses of Saxifragales with Divisestylus?to be most closely related to Iteaceae, being nearly identical in floral morphology but lacking the characteristic diporate, psilate pollen of the modern family. In contrast, the oldest potential member of Iteaceae proper, Iteaphyllum from the Eocene (ca. 49 Ma) Republic flora, Washington, USA, includes fossil leaves that co-occur with Itea sp. pollen in at least two localities. The worldwide fossil record of Iteaceae is extensive, and, while the modern family includes one eastern North American-eastern Asian disjunct taxon (Itea) and one taxon endemic to eastern Africa (Choristylis), fossils suggest that in the Tertiary Iteaceae also occurred in western North America from the Eocene to Miocene and Europe from the Eocene to Pliocene. In contrast, whereas Ribes is today distributed widely in the Northern Hemisphere and into the Andes of South America, the fossil record of Grossulariaceae largely consists of leaf compressions restricted to western North America. Previously published papers suggest that Ribes appears in the Cretaceous and is well-represented in Eocene to Pleistocene sediments. However, a reanalysis of the specimens on which this published record is based reveals that occurrences of Ribes leaf fossils are infrequent and restricted to the Eocene to Miocene in North America. Despite this, at least two subgeneric lineages within Ribes can be recognized by the mid-Miocene, Symphocalyx and Cerophyllum/Caloboytra, suggesting that they had diverged prior to that time. Saxifragaceae and Pterostemonaceae largely lack fossil records.American Society of Plant Taxonomists, Paleontological Society, National Science Foundation, L.H. Bailey Hortorium Moore Fund

title: Cornell University Library's Publishing Model for Scholarly Literature
abstract: Terry Ehling, Director of Electronic Publishing at Cornell University presented the Cornell University Library's approach to Scholarly Publishing on the Web. Using the example of the the Library's innovative publishing software, DPubS (Digital Publishing System), which was developed to deliver Project Euclid (a Mellon Foundation-supported scholarly communications initiative), she showed how Project Euclid provides cost efficient distribution of serial literature in mathematics and statistics, and now DPubS will be enhanced and released as a general-purpose publishing platform for scholarly literature in diverse fields, supporting peer review, extensive administrative functionality, and interoperability with open source repository systems

such as Fedora and DSpace. This flexible online publishing tool will aid institutions of higher education and research in managing and distributing the intellectual efforts of scholars and researchers. DPubS v.2 will significantly expand opportunities for affordable and creative scholarly communication.

title: Animal Husbandry at Cornell: A History and Record of Development from 1868 to 1963
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment.Animal husbandry at Cornell is as old as the university itself. It is hoped that those that study this early history will grasp the significance of the evolutionary growth and development of the College's functions in educating and training men and women for leadership, the contributions to animal agriculture through research, and the transfer of knowledge and technology to livestock producers, industries, and consumers. Progress and development of animal husbandry at Cornell from the beginning through 1963 provided a firm foundation for even greater accomplishments in the future in the animal science.

title: Bioarchaeology of the Cis-Baikal: Biological Indicators of Mid-Holocene Hunter-Gatherer Adaptation and Cultural Change
abstract: This bioarchaeological investigation of the Cis-Baikal skeletal and dental record focuses on health and lifestyle reconstruction of the region's mid-Holocene foragers with particular interest in the circumstances surrounding an alleged fifth millennium BC biocultural hiatus. The five cemetery populations considered - two representing the pre-hiatus Kitoi culture and three the post-hiatus Serovo-Glaskovo - provide an excellent opportunity not only to characterize boreal forest foraging adaptation, but also to investigate cultural change in the region. Research focuses on three discrete lines of bioarchaeological inquiry: dental enamel hypoplasia, osteoarthritis (degenerative joint disease), and paleopathology (both skeletal and dental). Results

reveal several discrepancies between the pre- and post-hiatus peoples, lending some support to previous assertions of distinct Kitoi and Serovo-Glaskovo adaptive regimes, particularly the narrower subsistence base and lower residential mobility of the former. For example, pre-hiatus individuals appear to have suffered greater physiological stress than their successors, likely reflecting seasonal or annual fluctuations in resource availability, and to have engaged in distinct activity patterns suggesting increased (and sexually disparate) logistical foraging in response to reduced residential mobility. However, remarkable parallels have also been observed between these two groups in terms of overall mobility, general health status, and numerous behavioral characteristics, suggesting a general pattern of continuity throughout the mid-Holocene period. Skeletal and dental data indicate that all occupants of the Cis-Baikal employed variable but effective adaptive strategies: despite their documented differences, both pre- and post-hiatus peoples appear to have been more than successful in exploiting the region's rich aquatic and terrestrial resources.Social Sciences and Humanities Research Council of Canada, Cornell University Graduate School, Einaudi Center for International Studies (Cornell University), Human Biology Program (Cornell University)

title: The Cornell Physics Department: Recollections and a History of Sorts
abstract: A professionally printed version of this 359-page book may be purchased through Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book, and ask to be contacted regarding payment.The late Paul Hartman chronicled in his delightfully unique writing style the growth and development of one of the strongest departments at Cornell. "The Physics Department of Cornell has had a long and illustrious history which is nowhere written down in any complete way. It was suggested that the present writer, now on a part time "retirement" appointment in the Physics Department, with which he has been associated during a period going back forty-five years, put together a history of the department." This is an updating of the 1984 manuscript in 1993.

Please include the indentifier: http://hdl.handle.net/1813/2095, and ask to be contacted regarding payment.Sheep are one of the most important animal agricultural species and how they grow is a topic of interest to farmers and agricultural scientists world-wide. This book, published in 1988, lays the foundation for an understanding of how tissues grow in relation to each other and to the maturity of sheep. It first describes the growth of a single sheep and then goes on to show how mature size, castration, gender, and breeds affect body composition at given stages of growth. Special emphasis is placed on modern quantitative methods to define the relative maturing rate, Q, of various parts of the body. The author makes use of an extensive data base on the body composition of Australian Merino and Dorset Horn breeds for comparison purposes. Detailed appendices define terminology, techniques for carcass dissection, suggestion indices for describing changes in body composition during growth, and provide detailed data on dissectible muscle weights in sheep. This classical book should be included in the collections of agricultural scientists and livestock farmers.

title: On Loyalty
abstract: Richard Miller (chair), Scott MacDonald, Jennifer WhitingIn this dissertation, I defend a particularist, developmental account of the demands of loyalty, particularly towards unchosen objects (e.g. familial loyalties, piety, and patriotism). After surveying the limited literature in the field, I begin by pursuing Bernard Williams' suggestion that the deepest loyalties in human life are not subject to justification on the basis of universalist moral theories. In general, I argue that modern ethical theory?both broadly consequentialist and broadly Kantian?cannot account for demands of special concern towards particular persons, groups, and traditions, because those theories are intrinsically insensitive to the intra-volitional values that inform such demands. In response to the inadequacies of the universalist views, I attempt to derive such loyalties from the intra-volitional structure of a mature human will. My argument describes the ground conditions of a morally mature will?conditions with which any tenable moral theory must be compatible. I hope to be describing

some of the essential features of human moral psychology as they are actually valued, features no moral theory can ignore while remaining faithful to the content of the lived moral life.
I make special use of Harry Frankfurt's account of volition, autonomy and commitment, especially his notion of volitional necessity?the idea that a moral agent is compelled to perform certain actions not as a result of the deliberations of practical reason, but because his caring for certain objects is itself partially constitutive of his will. However, I think this view is incomplete and so drawing on work by Jonathan Lear, I offer an account of the origins of moral responsibility in the course of personal moral development. I argue that moral responsibility can only be fully understood in light of how an agent achieves maturity as a reaction to and reflection of the public values of his social world.
I ultimately hold that the structure of any humanly valuable will is characterized by the sort of volitional necessities that give rise to the deepest demands of love and loyalty. Accordingly, any adequate conception of the mature moral agent must make room for loyalties directed at unchosen objects as acts of self expression.

title: ESTIMATION PROBLEMS FOR SATELLITE ORBIT AND ATTITUDE DETERMINATION AND FOR GPS-BASED REMOTE IONOSPHERIC SENSING
abstract: Prof. Mark L. Psiaki
Prof. Paul Kintner
Prof. Mark CampbellThree separate applications of estimation problems in satellite navigation and attitude determination and in ionospheric scintillation monitoring have been solved numerically. The first application is magnetometer-based autonomous orbit determination, the second application is attitude determination using a GPS antenna on a turntable, and the third application is ionospheric scintillation monitoring using semi-codeless dual-frequency GPS techniques.
As the first application, a magnetometer-based orbit determination batch filter has been improved and tested with real flight data to determine the performance of a low-cost autonomous orbit determination system. The spacecraft?s orbit, magnetometer biases, and correction terms to the Earth?s magnetic field are estimated by this filter. The maximum position error of this filter for a 24-hour batch of ?rsted data is 59.50 km without field model corrections, but is only 2.19 km with 10th order/degree field model corrections.
The second application develops the signal processing algorithm for a prototype of a new attitude sensor, one that uses a single GPS antenna mounted on a rotating turntable, and evaluates its accuracy using real data. The goal of this study is to experimentally validate this new concept. The new attitude sensor measures attitude by using the sinusoidal phase modulation of the GPS carrier signal that is caused by turntable rotation. The new sensor system has been demonstrated to work in practice, and its peak attitude error is between 0.4 and 1.9 deg for a 15 cm antenna mounting radius and a rotation rate of 1000 rpm.
The third application is to develop optimal semi-codeless algorithms to track weak dual-frequency P(Y) GPS signals during strong ionospheric scintillations and to test them with real and simulated RF data. The goal of this work is to determine whether these new algorithms are less prone to loss of lock during strong scintillations than are other semi-codeless algorithms. The tracking algorithms use extended Kalman filter (EKF) and smoother methods as part of a semi-codeless technique that performs maximum a posteriori estimation of the W encryption bits of the unknown P(Y) code, which are known to chip at approximately 480 KHz.
The algorithms have been successfully tested with real wide-band dual-frequency GPS data under normal signal strength and simulated scintillation conditions with strong amplitude and phase fluctuations. The C/N0 thresholds above which the Kalman-filter algorithm and the smoother algorithm can still track without

losing lock are found based on the computed steady-state standard deviation of the L2 carrier phase error from steady-state covariance analysis. This threshold roughly agrees with the tracking results for the simulation data and can be used to predict the possibility of loss of lock.NASA grants NAG5-8076 and NAG5-9612, NASA grant NAG5-11919, NASA grant NAG5-12211

title: SUBDUCTION ZONE-TO-MANTLE FLUXES OF TRACE ELEMENTS AT INTRAOCEANIC MARGINS AND IMPLICATIONS FOR MANTLE EVOLUTION
abstract: Chemical and isotopic anomalies in mantle-derived rocks have been explained by invoking the presence of recycled oceanic crust (i.e., material of crustal origin that is incorporated into the mantle at subduction zones) in their mantle sources. Differences between the chemical and isotopic characteristics of the ingoing slab material and those of the inferred slab-derived mantle reservoirs have been attributed to processes within the subduction zone that alter the composition of the ingoing slab. However, there have been few studies that have specifically examined the composition of residual slab material to determine the effects of subduction zone processing. I used a mass-balance approach to calculate residual slab compositions at nine intraoceanic subduction zones. I calculated residual slab trace element ratios and modern isotopic characteristics of ancient subducted slabs in order to examine the feasibility of mantle evolution models that posit a major role for subducted slabs. Using my calculated residual slab compositions, I was unable to reproduce the chemical and isotopic characteristics of the mantle that have been attributed to the incorporation of recycled crustal material. Modifications to my model to account for variations in mantle wedge composition and in crustal addition rates do not significantly alter these conclusions. My results therefore indicate that subduction zone processing alone is probably insufficient to produce the chemical and isotopic characteristics of inferred mantle reservoirs.

title: Algorithms for Some Clustering Problems
abstract: Committee Members: David Shmoys, Shane Henderson, Jon KleinbergThe first part of this work gives new insight into two well-known approximation algorithms for the uncapacitated facility location problem: the primal-dual algorithm of Jain & Vazirani, and an algorithm of Mettu & Plaxton. The main result answers positively a question posed by Jain and Vazirani of whether their algorithm can be modified to attain a desired "continuity" property. This yields an upper bound of 3 on the integrality gap of the natural LP relaxation of the k-median problem, but our approach does not yield a polynomial time algorithm with this guarantee. We also give a new simple proof of the performance guarantee of the Mettu-Plaxton algorithm using LP duality, which suggests a minor modification of the algorithm that makes it Lagrangian multiplier-preserving.

The second part of this work deals with a problem we call the maximum average ratio cut problem. The motivation for this problem is a desire to expose structure in populations based on genetic information. Specifically, solving this problem allows us to evaluate unusually low heterozygosity in subpopulations. We reduce this problem to the maximum cut problem with given cardinality, and implement a branch and bound procedure to find exact solutions.National Science Foundation

title: Radioisotope-Powered Self-Reciprocating Cantilever for Micro Power Generation
abstract: Prof. Amit Lal, Prof. Rajit Manohar, Prof. Michael Spencer, Micro electromechanical systems (MEMS) provide many devices in sub-millimeter size for sensing and actuation. However, the lack of size-compatible power supplies prohibits entire systems to be within the same scale. The same problem of battery scaling exists for micro electronic devices. Reported in this dissertation is a novel way of micro power generation with radioisotopes. Due to the high energy densities and long half-lives of selected radioisotopes, high energy density power sources with extremely long operation time are possible.

Conversion of direct charge collection to mechanical actuation is the main achievement. A cantilever with a conductive collector collects the emitted electrons from a Ni-63 beta source. Due to charge conservation, positive charges are left in the radioactive source. The resulting electrostatic force moves the cantilever toward the source. When the cantilever contacts the source, charges are neutralized and the spring force pulls the cantilever back to its initial position. This cycle repeats itself as long as the radioactive source is active. Therefore a self-reciprocating cantilever is realized. An electromechanical model is developed to characterize the cantilever and verified with experimental results. The factors that limit the energy conversion efficiency are discussed. Further, radio frequency (RF) pulse generation at the end of the reciprocation cycle is achieved using a dielectric cantilever with metal electrodes, due to the excitation of dielectric waveguide mode. This RF pulse could be used for self-powered remote sensing and wireless communication. To generate electricity, a piezoelectric unimorph replaces the cantilever. At the end of the reciprocation, the sudden release of the unimorph excites its mechanical vibration, thereby generating electricity through the piezoelectric element.

The radioisotope-powered self-reciprocating cantilever provides a single platform for mechanical actuation, RF pulse generation and electrical power generation. Integration of all these functions holds great potential to enable self-powered autonomous systems.DOE NEER Grant DARPA MTO

title: Back Side Charge Trapping Nano-Scale Silicon Non-Volatile Memories
abstract: Sandip Tiwari, Lester Eastman, Joel Brock A new alternative device structure for scalable silicon non-volatile memories was investigated. The difficulties in scaling current devices arise from the non-scalability of the gate stack formed by the tunneling oxide, floating gate and control oxide. The proposed device is based on storage of charge in silicon nitride traps in the back of a thin single crystal silicon channel. This is intrinsically different from conventional silicon non-volatile memory structures, in which charge is stored between the silicon channel and the gate.

The devices are fabricated on a modified silicon-on-insulator substrate that employs a stack of silicon oxide ? silicon nitride ? silicon oxide as the buried insulator. The charge trapping layer, silicon nitride, is separated from the silicon channel by a thin tunneling oxide and from a back gate by a thicker blocking oxide. The

device is written and erased by applying an electric field between the back gate and source and drain that causes charge to tunnel between the silicon channel and the trapping layer. When there is no voltage applied, charge is retained in the silicon nitride, hence the non-volatility of the memory. Charges stored in the silicon nitride traps change the potential of the silicon channel resulting in a threshold voltage shift of the device that is sensed using the front gate. The decoupling of the read function (front) from the write and erase functions (back) gives this device a unique advantage in scalability and the ability to operate simultaneously as a high performance transistor and as a non-volatile memory.
Back side charge trapping non-volatile memory devices were demonstrated for the first time. The fabrication process is described and the electrical characteristics are presented. Fabricated devices exhibit memory operation down to 50 nm gate length and double gate operation down to 20 nm gate length. The memory characteristics of the devices, programming times, cycling endurance and retention time are comparable to those of conventional front side storage devices. The new device has the potential to be scaled to 10 nm gate length, a significant improvement from current devices, for higher density and lower power semiconductor non-volatile memory.National Science Foundation through the Cornell Center for Materials Research, Foundation for Science and Technology (Portugal), European Social Fund (Third Community Support Framework)

title: An odyssey through sight, sound, and touch: Toward a perceptual theory of implicit statistical learning
abstract: Morten H. Christiansen, Michael Owren, Elizabeth Regan, Michael SpiveyIn order to steer through a world characterized by a complex mixture of variability and structure, organisms rely upon implicit statistical learning, the capability to extract probabalistic patterns occurring in environmental stimuli. Although statistical learning has been found to occur across a myriad of domains, there has been little investigation into the effect that sense modality and other stimulus attributes may have on learning. In a series of experiments, I investigate to what extent implicit statistical learning is constrained and influenced by the nature of the input

in which the statistical regularities occur. All experiments have in common the use of artificial grammar learning methodology, where adult participants are incidentally exposed to statistically-governed patterns and then are tested on their ability to apply their acquired knowledge to novel instances. Chapter 2 presents two experiments that compared learning across touch, vision, and audition, producing evidence for modality constraints. Specifically, the auditory modality displayed a quantitative learning advantage compared to vision and touch; additionally, each sense modality was more or less attuned to specific aspects of the input. Chapter 3 describes an experiment that further explored modality constraints by manipulating both the presentation format (temporal, spatial, or spatiotemporal) and presentation rate for visual and auditory material. Consistent with a modality-constrained view of learning, vision and audition were best at encoding spatial and temporal regularities, respectively. Finally, using a novel cross-over design, Chapter 4 presents three experiments that pitted abstract, amodal processing against stimulus-specific learning and found that statistical learning is mediated to a greater extent by stimulus-specific, not abstract, representations. Taken together, the results from these experiments suggest that statistical learning inherently involves learning mechanisms that are heavily influenced by the perceptual and sensory characteristics of the stimuli. I argue that a full understanding of statistical learning -- and likely other aspects of language and cognition will come only by specifying the role played by the senses. I conclude with a proposal for a perceptual, modality-constrained view of implicit statistical learning framed within the context of cognition as a whole.

title: MOLECULES ROTATING IN ELECTRIC FIELDS BY
QUANTUM AND SEMI-QUANTUM MECHANICS
abstract: My academic committee consisted of Greg Ezra (advisor), Ben Widom, and Paul Houston, all in the Department of Chemistry and Chemical Biology.The quantum and semi-quantum mechanics of rigid molecules rotating in static electric and intense nonresonant laser fields have been studied. Basic quantum features including energy level correlation diagrams, eigenfunctions, alignment, orientation, and time-dependent wave functions propagated under pulsed fields are calculated. Energy level nearest neighbor spacing disributions are the primary semi-quantum approach, but Husimi distributions, periodic orbits, and monodromy diagrams are also investigated. We have elucidated these facets of the quantum-classical correspondence in this important rotational model, which is classically nonscaling with mixed phase space.

title: Bulk GaN growth and Characterization
abstract: GaN is a wide bandgap semiconductor material that is used for fabrication of laser diodes, light emitting diodes, and high power, high frequency electronic devices. Due to the absence of free standing GaN substrates, these devices are fabricated on foreign substrates such as SiC, Sapphire, LiGaO2 or LiGaO3. Performance of these devices is reduced due to high dislocation densities resulting from lattice mismatch and thermal expansion coefficient mismatch between the GaN and substrate. In order to improve the performance of devices, homoepitaxial device layers grown on high quality free standing GaN substrates are needed. Bulk GaN crystals of dimensions 8.5 mm x 8.5 mm were grown at growth rates greater than 200mm/hr using gallium oxide vapor transport technique. Commercially available GaN powder and ammonia were used as the precursors for growing bulk GaN. Nitrogen was used as the carrier gas to transport the gallium containing

species that was obtained from the decomposition of GaN powder. These experiments were performed in a flow over configuration where the nitrogen carrier gas was flowing over the powder transporting the growth species. Using this process, it was possible to achieve growth rates of above 200 microns/hr. The GaN layers thus obtained were characterized using X-Ray diffraction, scanning electron microscopy, and atomic force microscopy. X-ray diffraction patterns showed that the grown GaN layers are single crystals oriented along c direction. AFM studies indicated that the dominant growth mode was dislocation mediated spiral growth. Hall mobility measurements indicated a mobility of 550 cm2/V.s and a carrier concentration of 6.67 x 10 18/cm3.

It was found that kinetics of decomposition of pure GaN powder without oxygen resulted in incongruent evaporation leading to the formation of the liquid gallium in the powder. A flow through configuration was also used because of its high collection efficiency of growth species. A mixture of Ga2O3 and carbon powder as well as commercial GaN powder were used as precursors of gallium suboxide in this configuration. This configuration also demonstrated growth rates that are comparable to flow over configuration.

title: A Framework for Large Eddy Simulation of incompressible flows with error control
abstract: This work developed tools to make Large Eddy Simulation (LES) more easily applicable to engineering problems. An iterative fractional step method was developed for LES. A block-matrix-based analysis procedure proved that two iterations are sufficient to achieve desired second-order temporal accuracy. Stretched Cartesian grids are mapped onto a uniform computational grid. The stencil of the pressure Poisson equation was reduced from seven to five points in each coordinate direction, while still requiring the volume fluxes to satisfy a fourth-order spatially discretized continuity equation to machine precision. The algorithm was implemented in parallel.

Improved criteria for comparing sub-grid models was obtained by comparing the statistics from the LES with those from the unfiltered Navier-Stokes equations. This allowed us to clearly define the convergence of an LES approach with resolution length scale, Δ. The difficulty in assessing the accuracy of the statistics obtained from an LES is solved by modeling the statistics of unresolved, or residual, motions. We then combine the ideas of convergence and modeling the statistics of residual motions to give a rationale for the choice of better values for sub-grid model parameters. The performance of these ideas is studied in the context of forced isotropic turbulence and temporal mixing layer.

In isotropic turbulence, extrapolation techniques were developed to determine the DNS statistics in the limit of infinite Re. The resolved kinetic energy (KE) converged to the same asymptote for the three eddy-viscosity models studied. Addition of modeled residual KE to resolved KE improved estimate for turbulent KE. Improved values for the sub-grid model parameters were obtained by removing the leading order $\Delta^{2/3}$ term in the total KE.

In mixing layer, Δ convergence of the volume-averaged total turbulent KE degraded with time. Eddy-viscosity models were poor models for residual shear stress because the modeled residual shear stress is aligned with the resolved strain rate. Improved model parameters, which minimized the Δ variation of the volume-averaged turbulent KE, strongly depended on the time. Hence, for the above low Re mixing layer LES, it is not possible to remove the Δ variation at all times, by choosing a single set of values.

title: OBSERVATION OF chi_b(2P) TO chi_b(1P) pi+ pi-
abstract: Committee Members:
Richard S. Galik, Louis Hand, Tomas A. Arias We have searched for the di-pion transition chi_b(2P) to chi_b(1P) pi+ pi- in the CLEO-III sample of Upsilon(3S) decays in the exclusive decay chain, Upsilon(3S) to gamma chi_b(2P), chi_b(2P) to chi_b(1P) pi+ pi-, chi_b(1P) to gamma Upsilon(1S), and, finally, Upsilon(1S) to l+ l-. We refute the null hypothesis, finding a signal greater than 6 sigma deviation from expected background, and thus claim observation of this di-pion decay. For comparisons we have used the well-established channels Upsilon(3S) to Upsilon(2S) pi+ pi-, with either Upsilon(2S) to l+ l- or Upsilon(2S) to gamma chi_b(1P). Under reasonable assumptions, we find the two-pion partial width to be, Gamma_(pi+pi-) = 0.80 +- (0.21) +- (0.23,0.17) keV.

title: Manly Vice and Virtu: State Specters, Secular Rituals, and Public Culture in Taiwan
abstract: P. Steven Sangren, Jane Fajans, Dominic Boyer, Sherman CochranThis dissertation is an ethnographic study of male sociality and public culture in Taiwan. I examine the poetics and politics of disreputable social activities in which cohorts of male friends engage regularly and extensively, including hunting, drinking, and gambling. My analytical point of departure is the concept of ?cultural intimacy,? which recognizes how shadowy public practices whose social efficacy derives from contravening official norms actually constitute the state as well as national and other identities. This approach departs from the orthodoxy of Taiwan (and China) studies by locating the political basis of society in the public realm rather than in the family and work. This study addresses three overarching questions: What are the micropolitics of disreputable social activities through which men negotiate status and identity and construct homosocial bonds of intimacy? How are mainstream gender values and norms perpetuated and reworked through these activities, and how do subversive forms become incorporated into everyday social repertoires? In what ways do these activities instantiate, resist, and reinforce state power and nationalist ideologies?
Ethnographically, my research focuses on three social activities: deep-sea spearfishing, carousing at hostess clubs, and high-stakes gambling at mahjong, each of which my informants understood to be subversive of societal norms. Methodologically, I structure my examination of each activity around an adaptation of classic ritual analysis--namely totemism, sacrifice, and ludus--and interpret each ritual activity in the respective mass-mediated context of public culture. In so doing, I explore the production of male sociality in relation to nature and environmental discourses, gender and sexuality, fate/luck and military training, as well as state ideology and global capitalism. Based on my findings, I argue that disreputable male social activities are key sites for the production of values and communities that reconfigure the contours of public culture, capitalism, and democratization in Taiwan, and that both contest and legitimate state power. By integrating ritual analysis and cultural studies approaches, I make an original contribution to gender studies in Taiwan/China and to anthropological studies of public culture and the nation-state.Fulbright, Cornell East Asia Program, Cornell Olin Fellowship

title: PARTIAL CHARACTERIZATION OF COYPU SCENT GLAND COMPOUNDS
abstract: Coypu are invasive rodents that are ravaging wetlands across their introduced range. Coypu have a sexually dimorphic (male larger) anal gland (AG) used in scent marking behavior. Using GC-MS, this

study looked for a similar dimorphism in compounds produced by the AG. Male AG extract contained 15 compounds. Of the 15 compounds, 6 are fatty acids of known structure. Nine of the compounds are partially characterized farnesene isomers. Each male AG chromatograph had the same compounds present, but in differing proportions. This suggests that coypu can use AG secretion to identify individual males. Such knowledge of compounds used in coypu chemical communication could be useful in developing coypu-specific attractants. The second part of this study used a computer program to identify individual coypu by marking and matching whisker-insertion patterns. It was found that whisker insertion pattern can be used as a ?fingerprint? to aid in the photographic identification of individual coypu.

title: Porous Silicon as a Proton Exchange Membrane for Direct Methanol Fuel Cells
abstract: Direct Methanol Fuel Cells (DMFCs) show the most potential in efficient chemical to electrical energy conversion having approximately half the specific energy compared to gasoline at 5.54 kW-hr/kg (19.9 MJ/kg). With a density of 0.792 kg/L, methanol?s energy density is 4.39 kW-hr/L. By designing a system to utilize methanol, the advantages from quick refills and the elimination of recharge times offer great motivation for further analysis on this topic. Furthermore, methanol is a relatively low cost alcohol/fuel with popular applications such as automobile windshield wiper and aircraft de-icing fluids. One major source of inefficiency within the DMFC is the electrolyte allowing fuel to cross over from the anode to cathode. Proprietary DuPont Nafion 117 has been the standard thus far for all meso-scale direct methanol power conversion systems and its shortcomings are primarily in the areas of slow anodic reaction rates and fuel crossover resulting in lower voltage generation or ?mixed potential.? Porous Silicon (P-Si) is traditionally used in photovoltaic and photoluminescence applications. Rarely is it used to function as a mechanical filter or membrane. The research deals with investigations into using P-Si as a functioning electrolyte to transfer ions from the anode to cathode of a DMFC. In addition, an effort to observe the consequences of stacking multiple layers of anodes is attempted. Porous silicon was fabricated in a standard Teflon cylindrical cell by an anodization process including varying the current density to etch and electro-polish the silicon membrane. The result was a silicon membrane with pore sizes of approximately 1.5 ?m when optically characterized by a scanning electron microscope. The porous membranes were then coated in approximately 0.2 mg/cm2 Pt-Ru catalyst with a 10% Nafion solution binding agent onto the anode. Voltage versus current data shows that an open circuit voltage (OCV) of 0.25V was achieved with one layer when operating at 20oC. When adding a second layer of porous silicon, the OCV was raised to approximately 0.32V under the same conditions. The experimental data suggests that the current collected also increases with an additional identical layer of anode prepared the same way. The only difference is that the air cathode side was surface treated to 0.1 mg of Pt black catalyst with a 10% Nafion binding agent to aid in the recombination of hydrogen atoms to form the water byproduct. Porous silicon endurance runs with 2ml of 3% by volume methanol (0.7425M) fuel dissolved in water show that an operating voltage was generated for approximately 3 hours before the level dropped to approximately 65% of the maximum voltage of 0.25V. Endurance runs with a second layer added extended the useful life of the cell by approximately 2 hours to 5 hours when tested under the same conditions. When tests were conducted for voltage generation by varying the methanol concentration, a linear relationship developed up until the point where methanol seepage through the porous membrane affected measurements. In an effort to quantify the results and confirm the usefulness of the addition of a second layer, Fourier Transform Infrared Spectrometry was conducted on a number of samples to verify the methanol concentration for each layer. Additionally, a pH test was conducted to measure the relative amounts of protons dissolved in solution between the layers.

title: Corrections to Radar-Estimated Precipitation Using Observed Rain Gauge Data
abstract: Chair: Dr. Daniel S. Wilks; Committee: Dr. Arthur T. DeGaetano, Dr. Patrick J. SullivanA new method is presented for calculating daily rainfall amounts from radar. Radar data from two River Forecast Centers (RFC), and daily rain gauge data from stations around the Northeast U.S. are used to create a radar-level resolution grid of rainfall. The purpose for this method is to produce fields of precipitation estimates in the operational area of the Northeast Regional Climate Center (NRCC), to archive the high-resolution precipitation product, and to use the product as input into a crop modeling program. Considering rain gauge observations as the true values, radar errors are calculated at each rain gauge location every day. Using an interpolation method, the errors are estimated at each radar pixel and added back to the radar grid. Thirty cases were selected from different times of year and different weather types. Three interpolation methods, Inverse Distance Weighting, Multiquadric Interpolation, and Ordinary Kriging, are compared to the Multisensor Precipitation Estimation (MPE), used operationally by River Forecast Centers. Parameters associated with each interpolation method are adjusted daily using cross-validation to produce the best results for each case. By using daily rain gauge data, all three interpolation methods perform similarly and better than MPE, which uses hourly rain gauge data. All methods for estimating precipitation perform best at low values of precipitation and worst at high values of precipitation. Because of the similarity in results between interpolation methods, the simplest method computationally, Inverse Distance Weighting, has been chosen to be used operationally for the Northeast Regional Climate Center.Cornell Initiative on Computational Agriculture, funded by a Special Grant of the USDA-CSREES

title: Infants' Perception of Musical Rhythm and Meter: Early Abilities and Developmental Change
abstract: This is my PhD dissertation in two parts.Perception of the temporal structure, or ?meter?, of music enables a range of socially and culturally significant musical behaviors such as synchronized dancing and singing. This dissertation combines developmental and cross-cultural comparisons to examine the perception of musical meter and its development during infancy. The first chapter reports that 7-month-old infants can categorize simple rhythms according to a common underlying meter. Infants also detect contingencies between positions in the meter and individual pitches, an ability that may bootstrap acquisition of knowledge about musical pitch structure. Chapter II shows that Western adults? knowledge of Western meter interferes with their ability to detect rhythmic disruptions in a foreign, Balkan meter. By contrast, adults exposed to both Western and Balkan music throughout childhood perform accurately in either context. Six-month-old infants, who have had relatively limited exposure to music, can detect metrical disruptions in either Western or Balkan contexts, which seems to indicate culture-general perception of meter. Chapter III reports a decline in 12-month-olds? performance only in the foreign musical context, which is consistent with the emergence of culture-specific metrical biases by this age. After 12-month-old infants and adults receive one or two weeks of brief, daily exposure to foreign music, infants can detect the rhythmic disruptions in foreign metrical contexts, but adults cannot. Overall, the findings document early sensitivity to culture-general aspects of metrical structure but rapid developmental change in response to culture-specific musical experiences.

title: THE AMERICAN COMMISSION FOR THE PROTECTION AND SALVAGE OF ARTISTIC AND HISTORIC MONUMENTS IN WAR AREAS: HISTORIC PRESERVATION IN EUROPE DURING WORLD WAR II
abstract: The subject of this thesis is historic preservation during times of armed conflict. Specifically, my purpose here is to evaluate a single effort in a discrete moment in time at a specific place: the American efforts during World War II to protect the historic buildings of Europe. To do so, the work of two civilian agencies is examined: the monuments subcommittees of American Defense-Harvard Group and the American Council of Learned Societies. Both groups were charged with sifting through the vast body of information on Europe?s cultural patrimony and rendering it usable by the Allied governments. These groups sent the information they gathered on to the American Commission for the Protection and Salvage of Artistic and Historic Monuments in War Areas, a Federal clearinghouse that, in turn, compiled the information and disseminated it to its military components serving in the various theaters of war. The final recipients of this information were the famed Monuments, Fine Arts and Archives soldiers of the United States Army. On their shoulders fell the responsibility of protecting the sweeping cultural heritage of Europe from destruction. Failing this lofty goal, they were charged with stabilizing damage to monuments where possible and recording the destruction where there was nothing left to save.

To evaluate the efficacy of this program, an examination of the city of Frankfurt am Main, Germany, is offered as a case study. Frankfurt was chosen for two reasons. First, it was typical. It was not a national capital like Berlin, Rome, or London, and thus was not rife with symbolic meaning as capital cities are. It was also ordinary in most other ways?in terms of population, history, built environment?and is arguably representative of European cities. The experiences of this city during World War II may fairly be extrapolated to those of others, not just in Germany but in other European nations as well. Frankfurt was also selected because it was the subject of a unique post-war photographic and textual survey of its historic buildings, now in the collections of the National Archives in suburban Washington, D.C. This rich resource has never been systematically analyzed.

My final assessment of these historic preservation efforts is fairly straightforward. I contend that no degree of military planning, political wherewithal, or plain good intentions would likely have spared much of the destruction suffered by Europe?s historic architecture. Even with landmarks earmarked for protection, the technology available during World War II was insufficient to guaranty against unintended damage (?collateral damage? in today?s parlance). The ?strategic, precision? bombing so often alluded to at the time, though strategic in bringing about the end of the war, was rarely precise, and many historic buildings suffered as a result.

My context here is historical. Yet this topic is as relevant today as it was in the 1940s. In spite of much-ballyhooed American ?smart? armaments and the effortless removal of desired targets with ?surgical? precision, wars still create confused, random environments. Unintended events with irreversible consequences still occur, and buildings earmarked for protection are destroyed. Adding to this confusion is a global information infrastructure, which allows news?and propaganda?to travel instantaneously to the far corners of the planet and shape international public opinion. Realizing the strategic potential in this, an enemy, even a militarily inferior one, can publicize the destruction of a monument (whether legitimately destroyed by its enemy or self-inflicted (like Nero?s Rome or Hitler?s Reichstag allegedly were)), and garner support while portraying the enemy as latter-day barbarians. And in this way, the tide of war can be shaped in ways that have little to do with military superiority.

title: Education, Environmental Attitudes and the Design Profession: A Masters Thesis
abstract: Jack Elliott, Charles GeislerAs the concept of sustainability continues to become more popular within society, a number of different professions are called on to help champion the movement. With the resource strain inflicted by the construction industry alone, dedicated architects and interior designers are important players in forward progress. Though many organizations and associations have been created to help the building industry embrace sustainability both practically and theoretically, the actual implementation of green building practices in construction has been minimal. The main focus of this study is to look at the influence of undergraduate education on designers? interest in sustainable design. Additional interest was in environmental attitudes and the impact of interpersonal relations on those attitudes.
Self-proclaimed practitioners in the green building industry were surveyed through a specified email list of the United States Green Building Council. The survey was web-based and addressed issues including environmental attitudes, undergraduate education and professional training. Dunlap and Catton?s widely-used New Ecological Paradigm scale was included to measure proenvironmental orientation of the professionals.
Contrary to the main hypothesis of the study, undergraduate education was not seen by subjects to be a fundamental force in the decision to concentrate on sustainability. A number of educational elements typically seen in environmental education, including interpersonal interactions, were mentioned by subjects as substantially influential and are therefore explored.

title: INVESTIGATION OF NEW CHEVREL PHASE COMPOUNDS FOR IMPROVED EFFICIENCY OF THERMOELECTRIC POWER GENERATION DEVICES
abstract: In the search for improved high-temperature thermoelectric materials, we investigate new Chevrel phase materials that combine substitution of Ru on some of the Mo sites and the intercalation of various metals into the Chevrel structure. We expect these materials to have low thermal conductivities, due to their rattling structure type. Nominal compositions are (generally) chosen to add 4 valence electrons to the basic Chevrel unit Mo6Se8, and make the structure semiconducting. Two series of compounds were synthesized, (CuyMo6S e8)1-x(Mo4Ru2Se8)x, with y = 2, 4 and x = 0, 0.2, 0.4, 0.6, 0.8, and MxMo5RuSey, with M = Zn, Cd, Sn and Pb, x < 1, and y < 8. These generally differ from loading stoichiometry, and only a few were found to be intrinsic semiconductors. For the first series we report the synthesis and transport property measurements, and for the latter we present the synthesis and characterization of each compound. Since nearly all previous studies of Chevrel phase compounds have exclusively involved either substitution or intercalation, this research is an important addition to the study of Chevrel phase compounds.

title: CONTRIBUTIONS OF SIGMA-B AND PRFA TO STRESS RESPONSE AND VIRULENCE GENE EXPRESSION IN LISTERIA MONOCYTOGENES
abstract: Dr. Martin Wiedmann, chair;Dr. John Helmann, Dr. Marci ScidmoreThe food borne bacterial pathogen Listeria monocytogenes has several mechanisms for regulating expression of stress response and virulence genes. The alternative sigma factor sigmaB is a global regulator of genes active under environmental stress conditions and during stationary phase growth. I identified a large portion of the genes regulated by

sigmaB using a promoter consensus sequence search and microarrays. sigmaB directly controls expression of at least 54 genes. The genes regulated by sigmaB encode proteins with a wide variety of functions, including basic metabolic pathways, membrane solute transporters, and stress resistance. In addition, I found six virulence genes, including bsh and five internalin genes, to be controlled by sigmaB. Another protein that regulates virulence gene expression in L. monocytogenes is PrfA. I measured expression of PrfA-dependent and sigmaB-dependent genes under conditions that activate each regulator, using quantitative reverse transcription-PCR (qRT-PCR). I found that sigmaB is active preferentially under environmental stress conditions, and activity decreases upon internalization of the bacteria by human epithelial cells. Conversely, PrfA is not active under stress conditions, but is highly active intracellularly. Additionally, I used qRT-PCR to determine that sigmaB contributes directly to prfA expression at the P2 promoter region. One gene initially identified in the microarray analysis to be sigmaB-dependent is lmo1433, which is predicted to encode glutathione reductase, an enzyme used by some bacteria to counteract oxidative stress. Characterizations of a strain bearing an in frame polar deletion of lmo1433 (delta-lmo1433), as well as a delta-sigB delta-lmo1433 strain, showed no difference in the strains' abilities to survive oxidative stress when compared to their respective parent strains, although presence of an intact sigB allele was important for survival. Likewise, the delta-lmo1433 and delta-sigB delta-lmo1433 strains did not show a difference in total glutathione reductase activity or intracellular survival and spread, as determined by plaquing ability on mouse L2 cell monolayers, when compared to parent strains.National Intstitutes of Health, U.S. Department of Agriculture

title: Custom-Quality Wire Routing Using Modern Design Rules
abstract: Rajit Manohar, Martin Burtscher, Sally McKeeThis thesis presents a wire routing methodology that produces custom-quality results. We use a gridless tile-based approach that extends previous works in four main ways. First, it captures all the intricacies of modern design rules, e.g. the difference between contact-to-contact spacing and contact-to-wire spacing. Second, it implements a robust cost model that includes: i) horizontal wire costs, ii) vertical wire costs, iii) via costs, and iv) jog costs. Third, a design-rule correct route is always guaranteed even if the search for the least-cost path is terminated early. Fourth, route ordering is dynamically updated based upon the routability of nodes. The resulting router is shown to route 1.5-11x faster than the Cadence Chip Assembly Router while consuming 6-8x less memory with 5-15% less wiring overhead.

title: Mechanically Adjustable Single-Molecule Transistors and Stencil Mask Nanofabrication of High-Resolution Scanning Probes
abstract: This dissertation presents the development of two original experimental techniques to probe nanoscale objects. The first one studies electronic transport in single organic molecule transistors in which the source-drain electrode spacing is mechanically adjustable. The second involves the fabrication of high-resolution scanning probe microscopy sensors using a stencil mask lithography technique.

We describe the fabrication of transistors in which a single organic molecule can be incorporated. The source and drain leads of these transistors are freely suspended above a flexible substrate, and their spacing can be adjusted by bending the substrate. We detail the technology developed to carry out measurements on these samples.

We study electronic transport in single C$_{60}$ molecules at low temperature. We observe Coulomb blockaded transport and can resolve the discrete energy spectrum of the molecule. We are able to mechanically tune the spacing between the electrodes (over a range of 5 \AA) to modulate the lead-molecule coupling, and can electrostatically tune the energy levels on the molecule by up to 160 meV using a gate electrode. Initial progress in studying different transport regimes in other molecules is also discussed.
We present a lithographic process that allows the deposition of metal nanostructures with a resolution down to 10 nm directly onto atomic force microscope (AFM) tips. We show that multiple layers of lithography can be deposited and aligned. We fabricate high-resolution magnetic force microscopy (MFM) probes using this method and discuss progress to fabricate other scanning probe microscopy (SPM) sensors.

title: MECHANISM OF RESISTANCE TO BEAN COMMON MOSAIC VIRUS CONFERRED BY THE I LOCUS IN PHASEOLUS VULGARIS L.
abstract: Resistance employed by plants to combat infection by pathogens from a broad range of species is frequently mediated by resistance genes (R genes). While R genes are known to be involved in pathogen recognition, how they convey this message to host defense machinery is not completely understood. These studies employ genetics and cell biology to evaluate the interaction of pathogen infection in resistant and susceptible host plants. The system used here is the I locus of Phaseolus vulgaris L. and the Potyvirus, Bean common mosaic virus (BCMV). Near isogenic lines for the I locus were challenged with BCMV at 20?C, 26?C and 34?C, and assayed over time using a number of different techniques. A protoplast system was developed for use in transfection experiments for determination of viral replication in the presence of the I allele. Confocal laser scanning microscopy was used in combination with fluorescence immunostaining to localize viral coat protein in resistant and susceptible responses. Genes that are differentially expressed in these isolines at 26?C and 34?C following inoculation with BCMV were detected using cDNA-AFLP. Protoplast experiments revealed that BCMV is able to accumulate in genotypes containing zero, one, or two copies of the I allele, although at different rates. Results from microscopic observations support the protoplast data and show that BCMV infects II, Ii and ii plants but that movement is restricted in resistant genotypes (II and Ii). cDNA-AFLP analysis revealed 20 genes that are differentially expressed during the infection process. Sequence analysis demonstrated that several of these genes are Phaseolus homologs of those known to be involved in plant defense responses in other well-characterized systems.

title: DAIRY INDUSTRIALIZATION AND SPRAWL IN AN UPSTATE NEW YORK COUNTY
abstract: Thomas A. Lyson; Max J. Pfeffer; Gilbert W. Gillespie, Jr.In this thesis I examine the interaction of agricultural industrialization and sprawl in an upstate New York county. A longitudinal representative case study of dairy farming in Ontario County, NY was conducted in order to evaluate the efficacy of the treadmill of technology and impermanence syndrome hypotheses in explaining dairy farm survival and expansion. According to the treadmill of technology hypothesis, larger farmers are more likely to adopt capital and management-intensive technology. They are then more likely to expand their operations in part to increase the returns on their investment. Those farmers that do not adopt these technologies are more likely to exit agricultural production. The impermanence syndrome hypothesis, on the other hand, holds that farms located in areas experiencing urban sprawl are likely to experience a number of negative

externalities, including complaints about their operations. These farmers are less likely to continue investing in their farms because they foresee selling their land to developers. These farmers are thus more likely to exit agricultural production.

The case study site, Ontario County, NY, was chosen because it has experienced many of the processes representative of the Northeast. Namely, the County is a traditional dairy farming area where the number of farms has been declining and the size of farms increasing. Also, the traditionally rural County is experiencing increasing urban sprawl emanating from Rochester.

I collected primary and secondary qualitative and quantitative data on the County in order to build the case study. Qualitative data included numerous site visits and interviews with community leaders and residents in order to understand the historical and socio-economic context. Quantitative data included Census of Agriculture data on the County's agricultural sector, with particular emphasis on dairy farming. I also used national Census data and tax parcel data to chart population and housing flows as well as the conversion of farmland to non-agricultural uses. Finally, the case study hinges upon surveys conducted on a group of Ontario County dairy farmers in 1993, 1998, and 2002. While the original intention of the study was to follow 50 dairy farmers over a 10 year period, the high number of farm exits among the group made this impossible. As such, my thesis discusses the results of the initial survey along with the farmers still dairy farming in 1998 and 2002.

Employing the analytic technique of pattern matching, the case study produced contradictory findings in terms of the two hypotheses examined. In terms of the treadmill of technology hypothesis, the on-farm panel surveys showed that adopting capital-intensive technologies increased the likelihood of expanding production to become a very large dairy farm but did not necessarily ensure that the farm would continue dairy farming. In terms of the impermanence syndrome hypothesis, the results show that scholars must be more precise when operationalizing their studies. While scholars have generally used the perception of sprawl as a proxy for objectively measured sprawl, the perception of sprawl was strongly associated with farm exit in the 1993 survey with objective sprawl being a stronger indicator in the 1998 survey. Likewise, complaints from neighbors were more associated with the size of the dairy farm than the existence of urban sprawl.

I showed that the treadmill of technology and impermanence syndrome hypotheses should not necessarily be seen as rival hypotheses but rather complement one another. That is, farms located in more rural areas are more likely to expand their production than those located in sprawl areas. Also, larger farms are more likely to perceive sprawl, in part because they are more likely to receive complaints.USDA Regional Project NE-177 Structural Transformation of the Dairy Industry

title: EFFECTS OF GLUTATHIONE PEROXIDASE 1, GLUTATHIONE PEROXIDASE 4 AND COPPER, ZINC-SUPEROXIDE DISMUTASE GENE KNOCKOUTS ON ENZYME ACTIVITIES, BODY SELENIUM AND RESISTANCE TO OXIDATIVE AND NITROSATIVE STRESSES
abstract: This thesis addresses two studies, 1) characterization of a glutathione peroxidase 4 (GPx4) haploid insufficient (+/-) mouse and 2) effects of different levels of glutathione peroxidase 1 (GPx1) and Cu, Zn - superoxide dismutase 1 (SOD1) gene dosage on enzyme _expression and responses to paraquat (PQ), diquat (DQ) and/or acetaminophen (AP) toxicity. These studies are united in a general way by addressing response to oxidative stress with altered antioxidant enzyme _expression and in a more specific way by involvement of two selenium (Se) containing glutathione peroxidases (GPx1 and GPx4) and SOD1. All three of these enzymes are believed to be involved in in vivo metabolism of reactive oxygen species (ROS).

GPx4 is structurally and functionally unique among selenoperoxidases since it functions as a monomer and is able to metabolize phospholipid hydroperoxides. GPx4 is more resistant to Se depletion than other

selenoperoxidases and deletion of both GPx4 alleles is embryonic lethal, indicating an important role that is not yet fully understood.

Experiment 1 examined the effects of deletion of one gpx4 allele at baseline and with a ROS challenge. GPx4+/- and wild-type (WT or GPx4+/+) mice were injected with 24 mg/kg body weight of the ROS generator PQ or phosphate buffered saline (PBS) control and sacrificed 4 h later. GPx4+/- mice had decreased GPx4 activity in lung, liver, kidney and testis, from 24 to 39% ($P < 0.05$) lower activity than WT. GPx4+/- mice had a 34% ($P < 0.05$) decrease in testis Se concentration. GPx4+/- had no effect on Se concentration, protein carbonyl formation (measure of oxidized protein) or GPx1 activity in other tissues or GPx3 and alanine aminotransferase (ALT) activity in plasma. In summary, deletion of one gpx4 allele demonstrated a range of effects on GPx4 activities and Se concentrations, but did not affect susceptibilities to pro-oxidant-induced protein oxidation in various tissues of mice.

SOD1 and GPx1 are often considered to detoxify ROS in the cytosol. SOD1 produces hydrogen peroxide from superoxide which GPx1 reduces to water. A dramatic increase in ROS lethality has been found in cells and mice lacking GPx1 or SOD1 (GPx1-/- or SOD1-/-) whereas GPx1-/- hepatocytes are protected against reactive nitrogen species (RNS) induced cell death.

Experiment 2 compared responses of mice with various gene dosages of both SOD1 and GPx1 in a 72 h survival trial to the ROS generator DQ (25 mg/kg body weight) or the putative in vivo RNS generator AP (600 mg/kg body weight). Although this experiment was limited by sample size and group death rates, some general trends emerged. The SOD1 knockout allele decreased AP-induced mortality and increased DQ-induced mortality ($P < 0.05$). The GPx1 knockout allele increased mortality from both AP and DQ ($P < 0.05$). In combination, mice with only one functional copy in total of SOD1 and GPx1 (GPx1+/-|SOD1-/- or GPx1-/-|SOD1+/-) had significantly decreased DQ survival time but unchanged AP survival time ($P < 0.05$). AP-treated GPx1+/-|SOD1+/+ mice died significantly earlier than control (<40 h) but GPx1+/-|SOD1+/- survival time was not significantly different from control (>72 h). SOD1 knockout was also associated with 28 to 34% decreases in GPx1 activity, ($P < 0.05$; +/+ vs. +/- and $P = 0.078$ +/+ vs. -/-), depending on SOD1 copy number). Plasma ALT peaked between 20-40 h (11740 ? 1074) with AP treatment and <20 h with DQ treatment (2129 ? 537) but was unchanged in all surviving mice.

In summary, there are a variety of responses to antioxidant enzyme knockouts and not all are detrimental to defense against oxidative stress. In Experiment 1, gpx4 deletion reduced tissue GPx4 activity and testis Se without increased susceptibility to PQ toxicity. In Experiment 2, SOD1 knockout was associated with high resistance to AP toxicity, high susceptibility to DQ toxicity and decreased GPx1 activity while GPx1 knockout was associated with increased AP and DQ mortality. Overall, the effect of SOD1 knockout on resistance to AP lethality was greater than the effect of GPx1 knockout on AP lethality.

title: LASER INDUCED LYSIS OF ESCHERICHIA COLI CELLS AND BACILLUS SUBTILIS SPORES
abstract: The principle of laser induced cell/spore lysis was explored in this project. E. coli K12 and B. subtilis spores were chosen as the target analytes. The lasers available for testing were of wavelength 980nm and 1480nm. As a proof of concept, a 2uL droplet of E. coli culture in nutrient broth was place on a hydrophobic surface. The tip of the laser fiber was placed directly above the droplet, and the droplet was exposed to 100mW (1480nm) or 200mW (980nm) for 4 minutes. An alternative setup of the droplet testing was also designed to prevent evaporation. The droplet was placed in a well made in 2mm thick PDMS and covered with a glass slide. The laser fiber was placed above the glass slide. The results showed that there was moderated lysis using both lasers. The percentage lysis was greater using 1480nm laser (21%) than the 980nm laser (14%). This was expected since the main cause of cell lysis is due to a sudden increase in temperature. The aqueous nature of

cells thus makes the lysis highly dependent on the water absorption coefficient, which is 50 times higher at 1480 nm than at 980 nm. The alternative setup showed slightly less lysis (9% for 980nm). The difference to the droplet experiment results indicates that evaporation occurred during the droplet test which resulted in a smaller testing volume and thus in higher exposure to the laser.

The next step was to test the laser in microfluidic channels in order to determine whether it would be applicable for a micro-bioanalytical system. A 25 parallel-channel design with channel widths of 50?m and depths of 100?m were fabricated on a silicon wafer and subsequently realized in poly(dimethylsiloxane) using soft-lithography. In addition to E. coli cells, the effectiveness of lysis of B. subtilis spores was also explored. Variable flow rates of 5?L/min, 2?L/min, 1?L/min and 0.5 ?L/min were implemented. The results showed a greater percentage of lysis of E. coli cells compared to the droplet method (31% for 5uL/min, 41% for 2uL/min, and 43% for 1uL/min). However, no lysis was observed for B. subtilis spores under any flow rate.

title: The Kroll Opera and the Politics of Cultural Reform in the Weimar Republic
abstract: THE KROLL OPERA AND THE POLITICS OF CULTURAL REFORM IN THE WEIMAR REPUBLIC

Rachel Emily Nussbaum, Ph.D, Cornell University, 2005

This dissertation deals with changes in cultural policy during the Weimar Republic and how they affected the structure of the German opera public. I pay special attention to the role of theater-goers' organizations such as the Berlin Volksb?hne, who formed a major part of the audience for Weimar Germany's best-known experimental opera, the Kroll Opera (1927-1931). The expansion of the opera public to include social groups who had previously been excluded was here combined with an attempt to reform opera aesthetically, to create an "everyday opera" which would do away with kitsch and make opera a viable art form capable of speaking to a modern audience.

The ideas of the Volksb?hne centered on community (Gemeinschaft) which involved using the theater as a way of uniting German society. In this way, they lined up with conductor Otto Klemperer's plans for an opera representative of the new republican state form. Although the opera was forced to close in 1931, I argue that it nevertheless managed to create its own public far beyond the elites who usually attended opera. The Kroll is an example of the transformation of the idea of the Bildungsb?rgertum , or the educated bourgeoisie, in the1920s. It has often been argued that this was an outdated idea in the Weimar era. However, it had considerable power at the time. Avant-garde critics who supported Klemperer's idea of an opera stripped of spectacle were actually part of the Bildungsb?rgertum due to their continued belief in the power of culture to unite disparate groups within German society. However, as the opera audience actually expanded to include the working class and white-collar workers, conflict surrounding the idea of Bildung (self-formation) was inevitable. What would have to change about operatic culture? Its form, its content or simply its price structure? The decline of the old bourgeois culture which had supported opera before 1914 meant that its heritage was placed in question. Would "an opera for every day" still be opera? My sources include the files of the Prussian state theater administration; the files of the Ministry of State; the records of Volksb?hne annual meetings, as well as the organization's published journals; and contemporary newspapers and music journals. title: A GEOMETRICALLY EXACT THIN-WALLED BEAM THEORY CONSIDERING IN-PLANE CROSS-SECTION DISTORTION
abstract: A fully nonlinear theory of a three-dimensional thin-walled beam, in arbitrary rectangular coordinates with the pole of the sectorial area at an arbitrary point and the origin of the sectorial area at an arbitrary point of the beam section, is developed to incorporate transverse shear, torsion-induced warping, and local-buckling-induced cross-section distortion. Based on a geometrically-exact description of the kinematics of deformation, this theory allows large deformation and large overall motion with a general out-of-plane warping function and a general in-plane distortion function. The present theory can exactly reduce to the classical Vlasov theory for vanishing shearing and cross-section distortion in the case of small deformation. The nonlinear weak form of the governing equations of equilibrium is constructed and the linearization of the weak form is derived. A finite element code is developed to implement this generalized thin-walled beam element. The results given by the post-buckling analysis are compared with numerical and/or experimental results to investigate the local buckling effect on the member behavior.

title: The Nowotny Chimney Ladder Phases: the role of electron counts and interfaces in the stability of intermetallic compounds abstract: Consists of 4 previously published articles (Chapters 1-4) and one unpublished (Chapter 5).This thesis consists of three investigations into the electronic structure of solid state materials. In each case a semi-empirical method, extended Hueckel (eH) or mu2-Hueckel (mu2) is used for qualitative insight, with LDA-DFT being used to calibrate the semi-empirical calculations.
The first part accounts for two empircal rules of the Nowotny Chimney Ladder phases (NCLs, intermetallic compounds of the form TtEm, T: groups 4-9, E: groups 13-15). The first rule is that for late transition metal NCLs there are 14 valence electrons per T atom. The second is a pseudo-periodicity with a spacing of cpseudo=c/(2t-m), for the stoichiometry TtEm. Both rules accounted are for by viewing the NCLs as constructed from blocks of the RuGa2 structure of thickness c/2, with successive layers rotated 90 degrees relative to each other. Sterically encumbered E atoms are then deleted at the interfaces between layers, followed by relaxation. eH calculations explain the special stability of RuGa2, the parent NCL structure, at 14 electrons per T atom. A gap between filled and unfilled bands arises from the occupation of two Ga-Ga bonding/Ru-Ga nonbonding orbitals plus all five Ru d levels per RuGa2 (7 filled bands for 14 electrons/Ru). We discuss the connections between this 14 electron rule and the 18 electron rule of organometallic complexes.
Second part of this thesis reports the synthesis, crystal structures, and electronic band structures of (pyrene)10-(I3-)4(I2)10, 1, and of [1,3,6,8-tetrakis(methyl- thio)pyrene]3(I3)3-(I2)7, 2. In both structures, the organic molecules form face-to-face cationic stacks which are separated from one another by a polyiodide network. eH Band calculations suggest that the stacks of pyrene molecules in 1 have undergone a Peierls distortion appropriate to a 3/4 filling of the HOMO bands of the stacked pyrene molecules. Band calculations on 2 suggest that it is a Mott insulator. The intermolecular contacts within both the polyiodide networks and the face-to-face stacks of organic cations are rationalized within the frontier orbital framework.
In the final part studies a two-dimensional structure map for AB3 binary transition metal compounds with variables appropriate for direct quantum-mechanical energy calculations: electron count and Delta Hii, the difference in d-orbital Coulombic integrals. The experimental structure map differentiates between the six known AB3 transition metal structure types: Cr3Si, AuCu3, SnNi3, TiAl3, TiCu3 and TiNi3. The theoretical map (based on mu2 calculations) gives good agreement with the experimental map. Further analysis of the mu2 results indicates that the major energetic differences stem from the varying number of three- and four-member rings of bonded atoms.

title: Patterns, Mechanisms, and Ecological Implications of Cattail (Typha spp.) Dominance in Great Lakes Wetlands
abstract: Committee: Barbara Bedford and Jed SparksMany wetlands of the Great Lakes region are increasingly dominated by species of cattails, including the native Typha latifolia, the introduced Typha angustifolia, and their hybrid Typha glauca. Cattails are observed to form dense stands of live and dead biomass that may reduce plant diversity and compromise wetland habitat value. Cattail expansion has been used as an indicator of environmental change in the Everglades, but a broad analysis of the distribution and impacts of the northern species has not been conducted. In this study, I examined the patterns of cattail distribution across the Great Lakes, explored one mechanism by which cattails attain dominance in several Lake Ontario wetlands, and experimentally measured the effect of cattail biomass on plant species diversity in one wetland.

Patterns at the regional scale were addressed by analyzing vegetation surveys of 90 wetlands around the Great Lakes. Surveys were conducted in collaboration with scientists from the University of Minnesota, Duluth and the University of Wisconsin, Madison as part of an EPA-funded research program, the Great Lakes Environmental Indicators project. I compared patterns of dominance of invasive Typha (T. angustifolia and T. glauca) with those of five co-occurring, native graminoids, Typha latifolia, Sparganium eurycarpum, Calamagrostis canadensis, Carex lacustris and Schoenoplectus tabernaemontani. In contrast to the native species, the invasive Typha species represented a larger proportion of the plant cover in wetlands where they occurred (16% vs. 2 - 9% for natives), and their occurrence was associated with lower species density (7.1 vs. 8.6- 9.7 spp/m2 for natives). Unlike the native species, the relative cover of invasive Typha was positively related to an index of agricultural intensity calculated for a wetland's watershed ($p<0.001$). Agriculture uniquely explained 10% of the variation in the relative cover of invasive Typha, after accounting for variation due to lake identity (21%) and mean water depth (6%).

Among six Lake Ontario wetlands, I investigated the relationship between cattail abundance, litter accumulation, and species density in two hydrogeologic settings. I hypothesized that litter biomass would be higher in the Typha-dominated, open embayment wetlands than the protected wetlands that contained a mixed marsh meadow community. The mean biomass of all litter was higher in the open wetlands (1.7 - 2.6 vs. 0.4 -1.2 kg/m2 for protected sites) and litter biomass was negatively related to species density ($r2=0.88$, $p=0.005$). I further explored whether variation in litter biomass could be explained by differences in production, decomposition or hydrology. Peak live biomass was similar across the six sites. Decomposition rates in the fallen litter layer explained some of the variation in total litter (standing and fallen), but could not account for the overall higher accumulation in the open wetlands. Between May and September 2004, wetlands open to the lake experienced a narrower range of monthly water levels than the protected wetlands. The more stable water levels and the higher density of standing cattail litter in the open wetlands may be limiting the physical removal of litter, resulting in greater litter biomass.

Within one cattail-dominated wetland, I experimentally tested the hypothesis that an accumulation of cattail litter reduced species density. I added and removed both standing and fallen litter, and transplanted test seedlings into all plots. After 14 weeks, I found that fallen litter negatively influenced seedling survival ($p=0.061$) and species density ($p=0.024$), but the effect of standing litter was insignificant. In summary, both observational and experimental data indicate a negative relationship between cattail litter biomass and species density. Therefore, factors affecting cattail litter production (e.g., agriculture) and decomposition (e.g., water levels) could have important implications for cattail dominance and species diversity in Great Lakes wetlands.

title: Design of Plasmid Amplified DNA Building Block Synthesis System and Evaluation of Dendrimer-Like DNA Based Fluorescent Nanobarcodes
abstract: Masters ThesisMethods for producing DNA building blocks with high purity and yield were investigated, including solid-phase DNA synthesis and plasmid amplified DNA synthesis (PADS). In addition, an analysis of the properties of dendrimer-like DNA (DL-DNA) as nanobiosensor was conducted to explore the viability of its real-world application.

Four-armed dsDNA building blocks (X-DNA's) were successfully acquired using solid-phase synthesis. X-DNA consisted of 4 oligonucleotides that are partially complementary such that a cross-shaped dsDNA molecule is formed upon annealing. It was ligated to a 30bp dsDNA spacer immobilized onto micrometer-sized 6% cross-linked agarose beads via biotin-avidin interactions. A subsequent washing step was performed to rid the sample of non-X-DNA structures, and X-DNA was released from the spacer by restriction enzyme digestion. Gel electrophoresis of the product showed higher purity, 72% compared to 67.5% shown in the solution-hybridized X-DNA prior to solid-phase. Characterization of X-DNA was performed by ligation of 4 complementary hairpin loops which serve to close off all open dsDNA ends and prevent the structure from exonuclease digestion. Unchanged DNA concentration after 15 and 30 min of ExoIII digestion at 37oC was observed, confirming the synthesis of X-DNA.

Plasmid amplified DNA synthesis takes advantage of the natural DNA producing system in Escherichia coli for high-yield production of plasmids containing sequence for three-armed DNA building blocks (Y-DNA). A nicking enzyme was used to produce a single-stranded break in the plasmid. ExoIII digestion at 37oC was performed to produce ssDNA plasmids. Annealing at 70oC causes a branched hairpin (Y-shape) to form on each ssDNA strand. Simultaneous digestion of the Y-shape hairpin by three enzymes produces Y-DNA. Single and combinational of enzyme digestion was applied to characterize the ssDNA plasmid, and determined to be a Y-shape structure.

Lastly, fluorescent DNA nanobarcodes were analyzed for their purity, coding capability, compared to concentration-based coding method, as well as differential bleaching of green (G) and red (R) fluorescence. Pure populations of DNA nanobarcodes (4G1R, 2G1R, 1G1R, 1G2R, 1G4R) and multi-code mixtures, immobilized on 5.5um polystyrene beads, were obtained. The fluorescent intensities (R and G) were measured from 12-bit images taken by a wide-field microscope; the illumination source is a Mercury arc lamp and respective fluorescent colors obtained using green and far-red filters. The purity of each population was assessed by analyzing the magnitude of R/G fluorescent ratio standard deviation for each pure barcode populations (N>50beads). Comparison of the mean for each codes to a theoretical R/G ratio yield their codability. The DNA nanobarcodes were determined to be pure and their experimental R/G ratios conform to theoretical values, unlike concentration-based DNA barcodes. Bleaching analysis of red and green fluorodyes reveal that red dye bleach faster than green, however the ratio of R/G, and nanobarcodes, did not change significantly over time.

title: Considerations for Dairy Farms Regarding Use of Sewage Sludges, Sludge Products and Septage
abstract: Sewage sludges and sludge-based products can be used as agricultural soil amendments. They can provide a free or low-cost source of organic matter, nutrients and sometimes lime. Those entities responsible for sludge management provide farmers with their assessment of the benefits of land application. There are specific considerations regarding sludge use on dairy farms for animal, human, soil and plant health as well as for relationships with neighbors. This document is intended to help dairy farmers and their advisors make informed decisions regarding the use of sewage sludges, sludge-based products and septage and to outline measures that can reduce the risks that may be associated with application on dairy farms.

title: IMAGE PROCESSING OF DNA NANOBARCODE
abstract: Master of Engineering ThesisAn image processing software package was designed to assign clearly distinguishable colors to DNA nanobarcode probes labeled with varying ratios of red and green fluorescent dyes. The DNA nanobarcode probes were produced using novel tri-strand Y-shaped DNA secondary structures. These Y-shaped DNA structures are multivalent and anisotropic, allowing for specific and controlled hybridization to other Y-shaped DNA building blocks to create a dendrimer-like DNA structure (DL-DNA). Here, the image processing of fluorescence-intensity-encoded nanobarcodes was explored using the MATLAB software environment. DNA nanobarcodes were created with varying green:red intensity ratios: 4G1R (4 green : 1 red), 2G1R, 1G1R, 1G2R and 1G4R. Additionally, these nanobarcodes incorporated specific molecular probes to target the DNA of bacillus anthracis (anthrax), francisella tularensis (?rabbit fever?), Ebola virus, a positive control and corona virus (SARS) respectively. Fluorescence was amplified by attaching DL-DNA to polystyrene beads through biotin-avidin interactions. The nanobarcodes were visualized using a fluorescent microscope and pseudocolor images were obtained. These images were easy to distinguish for 4G1R (bright green) and 1G4R (bright red), but were difficult to distinguish for other ratios which showed up as different shades of yellow, green and orange. Using the image processing software, these nanobarcodes were assigned highly distinguishable colors based on their green:red intensity ratio, allowing for easy and fast visual identification of the pathogens targeted. With further development, this software package will be able to assign at least 25 different and visually distinguishable colors for two and three fluorescent dyes arranged in varying ratios to create high throughput visual screening of harmful pathogens.Cornell University, Molecular Bioengineering Laboratory

title: Stirring Times in Austria, 1898
abstract: Article, 27 pagesMark Twain spent two years (1897-1899) traveling in Central Europe, staying mostly in Vienna. While there, he reported on the famous sittings of the Austrian House in 1897 during which the conservative government sought to push through the renewal of the Ausgleich [Compromise] agreement against the will of the German Liberals (Twain calls them "the Left" or "the Opposition"). The government at the time was headed by Count Badeni (a Polish aristocrat whose full name was Kazimierz Felix), known as a "strong man" for his overbearing governance of Galicia. His appointment resulted in the slow collapse of German control over the monarchy. The reason for the 1897 legislative crisis was that Badeni had issued a language ordinance that gave Czech equal status with German even within the "inner service" (meaning between government departments). The German liberal opposition was so incensed that it vowed to obstruct the Ausgleich renewal until, in Twain?s words, "the obnoxious Czech-language measure should be shelved." In the wake of the often violent protests, both within the House and in Prague, Vienna, Graz, and elsewhere in the monarchy, Emperor Franz Joseph dismissed Badeni. In the absence of a majority within the House, however, legislative action came to be undertaken increasingly by imperial emergency provisions which the parliament was not in session. This in turn further sapped the government of its remaining legitimacy. Twain outlines all these events with characteristic wit in this piece.

title: Rehabilitating Killer Serials: An Automated Strategy for Maintaining E-journal Metadata
abstract: Cornell University Library (CUL) has developed a largely automated method for providing title-level catalog access to electronic journals made available through aggregator packages. CUL's technique for automated e-journal record creation and maintenance relies largely on the conversion of externally supplied metadata into streamlined, abbreviated-level MARC records. Unlike the Cooperative Online Serials Cataloging Program's recently implemented 'aggregator-neutral' approach to e-journal cataloging, CUL's method involves the creation of a separate bibliographic record for each version of an e-journal title in order to facilitate automated record maintenance. An indexed local field indicates the aggregation to which each title belongs and enables machine manipulation of all the records associated with a specific aggregation. Information encoded in another locally defined field facilitates the identification of all of the library's e-journal titles and allows for the automatic generation of a Web-based title list of e-journals. CUL's approach to providing title-level catalog access to its e-journal aggregations involves a number of tradeoffs in which some elements of traditional bibliographic description (such as subject headings and linking fields) are sacrificed in the interest of timeliness and affordability. URLs and holdings information are updated on a regular basis by use of automated methods that save on staff costs.

title: Advancing Scholarship Through Library Collaboration
abstract: This paper traces the history of library cooperation, from early attempts such as the Farmington Plan through successes in tech services and collection development, and from national to international cooperation. The author suggests that the only way libraries can now successfully confront the societal and economic pressures they are now facing is through continued cooperation. This continued cooperation might be realized in the creation of regional repositories, the pooling of information and data, or continued collaboration with creators of information via open access and institutional repositories. Every division of the library, including acquisitions, cataloging, and digitization, will need to be involved in this continued

collaboration for the library to continue its success in the twenty-first century.

title: Laughter in Congenitally Deaf versus Normally Hearing College Students: An Acoustic Analisis
abstract: Committee members: Dr. Michael J. Owren, Dr. Michael H. Goldstein.
This work was done in collaboration with Dr. Michael J. Owren and Dr. E. Sumie Funayama.The developmental and phylogenetic origins of human laughter are not well understood, with available evidence inconsistently suggesting both innate stereotypy and high variability in laughter acoustics. We examined this issue by investigating laughter in 19 congenitally deaf college students, with little or no auditory experience, and in 23 normally hearing college students. Acoustic analyses focused on temporal and spectral features, as well as vocal production modes. Repeated-measures ANOVA testing indicated marked similarity in laughter produced by the two groups. Acoustic differences that did occur in amplitudes ($p < 0.01$) and durations ($p < 0.01$) of the laughs likely reflect socially prescribed suppression of loud vocalizations by the profoundly deaf, but may also result from higher phonation thresholds or weakened vocal-fold responsivity. Finding overall similarity in laugh acoustics indicates an innate foundation for the neural circuitry involved, and that specific auditory experience is not a prerequisite for the development of these species-typical sounds. Nonetheless, laugh acoustics within both groups were also quite variable, suggesting diversity, rather than stereotypy in underlying motor behavior.This research was supported in part by a grant from Cornell University Field of Psychology Graduate Student Research Awards Fund.

title: The role of arbuscular mycorrhizal fungi in pasture colonization by the tropical forest tree species Terminalia amazonia
abstract: At three sites in Siete Colinas, Coto Brus, Costa Rica, I examined differences in composition of arbuscular mycorrhizal (AM) fungi between forest fragments and pastures, and consequences of these differences for seedling establishment in pastures by the tropical forest tree Terminalia amazonia.
I estimated species composition of AM fungi through spore counts from field soils and greenhouse cultures. The AM fungal community differed between forest and pasture. While some AM fungi were common in both habitats, others were abundant in one and rare or absent in the other.
To assess the importance of the change in community composition for pasture colonization by T. amazonia, I planted seedlings inoculated with either forest or pasture soil in forest and pasture, and compared survivorship, growth, and root colonization by AM fungi. Seedlings inoculated with forest soil experienced lower mortality, and greater initial growth rates and colonization by AM fungi, than seedlings inoculated with pasture soil. Differences in growth and survivorship may have resulted from differences in the AM fungal community or other differences between forest and pasture soils.
To determine whether AM fungal communities differ in their benefit, I compared the growth of seedlings inoculated with either spores obtained from forest or pasture, or with spore-free media. Seedlings inoculated with forest AM fungi had the highest root colonization, shoot phosphorus, and biomass. Seedlings inoculated with pasture AM fungi differed little from controls.
I used molecular analysis to identify which AM fungi colonize forest T. amazonia, pasture-grown seedlings, and dominant pasture grasses. AM fungal communities of seedlings planted into pastures did not reflect those of the other plants, suggesting the importance of both environment and host in determining AM fungal community composition.
Conversion of forest to pasture alters the AM fungal community. Seedling survival is higher for seedlings inoculated with forest than with pasture soil. At least some pasture AM fungi reduce mycorrhiza formation and seedling growth of T. amazonia relative to forest AM fungi. Seedlings colonizing pastures do not form mycorrhizas with the same symbionts as in forest. The significance of these differences for forest regeneration in tropical pastures merits further exploration.

title: Fostering Open Access at CUL by the use of Open Access Repositories (OARs)
abstract: Libraries in general and CUL in particular, have always been committed to providing free, open and un-impeded access to information. But as the cost of peer-reviewed scholarly literature, especially in the sciences, continues to increase we find ourselves being forced to make difficult decisions about how to allocate our limited resources. How do we strive to meet this commitment in the face of declining budgets and increasing costs? Several models of open-access publishing have been suggested, and task forces have been convened and have issued reports regarding those models. (see for example http://techreports.library.cornell.edu:8081/Dienst/UI/1.0/Display/cul.lib/2004-3) Ultimately we come to the same conclusion--we must continue to make the access to scholarly information and literature free to our users. But providing that access always has and will continue to come at a cost to the library.

title: Unsteady aerodynamics of falling plates
abstract: We investigate the problem of falling paper by solving the two dimensional Navier-Stokes equations subject to the motion of a free falling body at Reynolds numbers around 10^3, which is typical for a leaf or business card falling in air, and experimentally, by using a quasi two dimensional set up and high speed digital video at sufficient resolution to determine the instantaneous accelerations and thus deduce the fluid forces. We compare the measurements with the direct numerical solutions of the two-dimensional Navier-Stokes equation and, using inviscid theory as a guide, we decompose the fluid forces into contributions due to acceleration, translation, and rotation of the plate. The aerodynamic lift on a tumbling plate is found to be dominated by the product of linear and angular velocities rather than velocity squared as appropriate for an airfoil. This coupling between translation and rotation provides a mechanism for a brief elevation of center of mass near the cusp-like turning points. The Navier-Stokes solutions further provides the missing quantity in the classical theory of lift: the instantaneous circulation, and suggests a revised ODE model for the fluid forces. Experimentally and numerically, we get access to different dynamics by exploring the phase diagram spanned by the Reynolds number, the dimensionless moment of inertia, and the thickness to width ratio. In agreement with previous experiments, we find fluttering (side to side oscillations), tumbling (end over end rotation), and apparently chaotic motion. We explore further the transition region between fluttering and tumbling using both direct numerical solutions and the ODE model. In particular, by increasing the non-dimensional moment of inertia in the direct numerical simulations, we observe a wide transition region in which the cards flutter periodically but tumble once between consecutive turning points. In this region, we also observe a divergence of the period of oscillation, with the cards falling vertically for distances of up to 50 times the card width. We analyze the transition between fluttering and tumbling in the ODE model and find a heteroclinic bifurcation which leads to a logarithmic divergence of the period of oscillation at the bifurcation point.NSF, ONR, AFOSR, Packard Fundation

title: Using Controlled Vocabularies to Manage Resource Relationships: The KMODDL Experience
abstract: The Kinematic Models for Design Digital Library (KMODDL) exemplifies digital collections in which groups of objects are versions of the same resource and which resources are related to one another taxonomically. Other objects in the collection are supplementary materials that explicitly cite the primary KMODDL resources. To manage the complex relationships among KMODDL objects while maintaining the DC one-to-one principle, metadata developers established controlled vocabulary encoding schemes

that linked related objects. The solution implemented enables users to find all versions of a resource and all supplementary materials that cite the resource in a single search.

title: Rome During Avignon: Myth, Memory, and Civic Identity in Fourteenth-Century Roman Politics
abstract: Paul R. Hyams, John M. Najemy, Marilyn Migiel, Tom V. Cohen. My dissertation examines the social and political ramifications on Rome of the papacy's 1304 departure for Avignon. In this least-studied of Roman centuries, citizens weathered economic shock, loss of prestige, and a traumatic impact on their sense of political relevance. Questioning their city's identity, some turned to the communal model, while others sought to revive Roman claims to empire. Incorporating sociological, anthropological, and psychological theories of memory, my study investigates how social groups employed myth and collective memory to legitimize existing power or to introduce reforms.
Traditional scholarship has it that ideological conflict with the papacy defined the early Roman commune. However, a sustained analysis of the major chronicle sources - John of Salisbury, Otto of Freising, and Matthew Paris - reveals that cooperation was also an important defining element of communal-papal relations beginning with the 1143 revival of the senate. The early commune, moreover, seeking legitimacy, frequently entreated the German emperor to return to Rome.
The empire grew in stature in the Roman political imaginary between 1300 and 1343. The papacy's departure was attended in early century by five major popular revolts that frequently appealed to Romans' mythologized belief in their inherited claims to empire. As Rome lost political power in the papal absence, Romans enhanced their symbolic power by appealing to lasting myths.
In mid-century, Romans often fought socio-political battles through the medium of culture. Classical learning and historical memory became important tools, underscoring the class dimension of early humanism. Though elites had traditionally used the ancient past to legitimize their power, Romans of varied backgrounds began acquiring classical educations and writing history. The Anonimo romano, Giovanni Cavallini, and, most seriously, Cola di Rienzo, who incorporated ancient rhetoric, political theory, and learning into his political persona, all challenged elite dominance through extensive classical learning.
Cola's ritualized murder and Charles IV's subsequent imperial coronation at Rome reveal the profoundly changing political landscape after Cola. The imperial ideal suddenly disappeared from political rhetoric, Romans forgot Cola, and the Felice Societa' inaugurated a period of stable popular government predicated on a culture of oblivion.Cornell University Department of History, Institute for European Studies

title: EVOLUTIONARY, STRUCTURAL AND FUNCTIONAL ANALYSIS OF DROSOPHILA MELANOGASTER SEMINAL FLUID PROTEINS
abstract: During mating, Drosophila melanogaster males transfer accessory gland proteins (Acps) in the seminal fluid, along with sperm, to their mates. Acps mediate behavioral and physiological changes in mated females. These changes include increases in oogenic and egg-laying rates; and decreases in lifespan, sperm storage, and female's propensity to remate. A previous evolutionary EST screen in D. simulans identified a large candidate set of Acps. I organized a lab-wide annotation and male-expression confirmation of these candidate Acps in D. melanogaster, thus generating a collection of 52 stringently-selected Acps. Comparative structural modeling was then performed on 28 Acps which fall into several protein classes, including regulators of proteolysis, lipid modification, immunity/protection and cysteine-rich secretory proteins. Many of these same protein structural classes are found in the seminal fluid of mammals, suggesting a conservation of seminal protein roles. A cross-species evolutionary analysis was also performed on the 52 Acps, which identified many rapidly evolving Acps (an excess of non-synonymous/synonymous substitutions, absence of homologs in D. pseudoobscura, and low codon bias). To address the functions of Acps two reverse genetic techniques were utilized. First, ectopic expression lines were generated for 22 Acps and unmated females ectopically expressing individual Acps were tested for functions in egg-laying, receptivity, lethality, and antibacterial activity. These analyses identified two Acps that are toxic upon ectopic expression and three that enhance a females? immune defense. Though ectopic expression provides a high-throughput analysis of individual Acp function, it does not provide as rigorous a test of function as a knockout. A knockout of Acp62F, a protease inhibitor, was generated via homologous recombination. Protease inhibitors have been suggested to function in multiple reproductive processes, such as protecting sperm or regulating seminal proteins processing. I found that the sperm of Acp62F null males are less effective in preventing displacement of a subsequent male?s sperm than normal males. Acp62F, which localizes to the sperm storage organs, may thus play an important role in competition between sperm from multiple males within the female.National Institutes of Health Department of Education

title: Robust Statistical Tests for Detecting the Effects of Interspecific Competition on Ecological Communities
abstract: For seventy years ecologists have debated to what extent competition affects the composition of ecological communities. At one extreme, species have been proposed to assemble independently of each other, while at the other extreme, competition and other interspecific interactions have been proposed to account almost solely for the composition of communities. Although the debate bears broadly on applied and basic ecology, it has been challenging to resolve.
The most practical approach toward resolving the debate has been null model testing. The testing begins by assuming a null hypothesis that is reflective of an absence of competitive effects, which is then used to make a statistical prediction about the observed data. If observations are inconsistent with the prediction, then

the null hypothesis is rejected, and effects of competition are inferred.
Unfortunately, as I show here, all existing null model tests are biased or non-robust. Although both qualities are problematic, the non-robustness is particularly troubling, because it means that when assumptions of the tests cannot be verified ? as is usually the case ? the tests will incorrectly indicate competitive effects unacceptably often. Thus, the tests are unreliable.
To fix the problem, I derive robust tests. Letting i and j denote the ith and jth colonists to arrive at a site, respectively, and W(i,j) the event that i and j belong to the same ?unit? (e.g., functional group, genus), I derive how partitions of colonists into units will be distributed if for all i and j, W(i,j) is conditionally independent of whether i and j share unit membership with the other colonists. Because the distribution can be derived without parametric assumptions, it can be used to test robustly for competitive effects.
I conclude by applying one of the tests to seven large data sets. In no cases does this test suggest effects of competition, although it does sometimes suggest effects of other interspecific interactions (e.g., facilitation). Overall, the predicted distribution accounts for over 95% of the variation in frequencies of partitions. Hence, the results suggest that although interspecific interactions may discernibly affect the composition of communities, those effects are generally minor.National Science Foundation Graduate Research Fellowship Program

title: Public Secrets from Peru
abstract: A play about political violence in Peru.In deciding to create a drama about violence in Peru, I have moved away from the usual academic discourse into the arena of performance. I have made this move for a number of reasons: foremost is my desire that English-speaking audiences (and readers) hear the words of those whose stories I and my colleagues have recorded because I know that tales of terror engender denial on

the part of the listener. Perhaps dramatic form can provide a tolerable means of communication as a product of imagination, a fantasy, and to borrow a phrase that Taussig used in 1993 at a lecture at Cornell. It captures the 'reality of the really made up.' My hope is that by the end of this play, my interlocutor will have a new sense of the complex motivations of victimizers and victims caught in an increasing spiral of violence.

title: THE LOCAL BEHAVIOR OF THE SHRINK-WRAPPING ALGORITHM FOR LINEAR PROGRAMMING
abstract: James Renegar, ORIE
Sidney Resnick, ORIE
Louis Billera, MathematicsHyperbolic polynomials and their associated hyperbolicity cones have origins in partial differential equations. Recently, these structures have drawn considerable attention in the optimization community as well. It turns out that most of interior point methods (IPM) theory applies naturally to the class of conic programming problems arising from hyperbolicity cones. In particular, linear programming (LP), second-order conic programming (SOCP) and positive semi-definite programming (SDP) are themselves instances of conic programming problems of this kind.
The thesis consists of two parts. The first part is devoted to the structure of a particular family of hyperbolicity cones which give a sequence of relaxations to the nonnegative orthant. The second part contains analysis of the newly proposed algorithm for LP based on these relaxations.
While one can easily construct a logarithmic self-concordant barrier (SCB) functional for the hyperbolicity cone K_p associated to an arbitrary hyperbolic polynomial p, little is known about its dual cone ${K_p}_*$. This problem is closely related to LP itself: for the case of $p(x)=E_n(x)=\prod_{i=1 \ldots n} x_i$ the (closure of the) hyperbolicity cone is self-dual and is, in fact, $\Re^n_+$. Elementary symmetric polynomials can be thought of as derivative polynomials (in a certain sense) of $E_n(x)$, and are building blocks for hyperbolic polynomials themselves, their associated hyperbolicity cones giving a natural sequence of relaxations for $\Re^n_{++}$. We give an algebraic characterization for the dual cone associated with $p'(x)=E_{n-1}(x)=\sum_{1 \leq i \leq n} \prod_{j \neq i} x_j$ which was previously unknown and show how one can easily construct a SCB functional for this cone. We comment on possible extensions of this result.
Recently a new paradigm for LP has been proposed (J. Renegar). It relies on the consecutive relaxations of the nonnegative orthant using hyperbolicity cones associated with elementary symmetric functions. In a way this gives a generalization to the notion of a central path in IPM. We analyze the local behavior of the newly proposed algorithm in the neighborhood of the optimal LP solution demonstrating that the resulting sequence of iterates will converge at least super-linearly to the solution (under some non-degeneracy assumptions).

title: Essays on Econometric Models of Relative Prices
abstract: The first chapter addresses the degree to which models which exhibit nonlinear mean reversion, such as the smooth transition autoregressive model, present a resolution to the purchasing power parity puzzle (see Rogoff, 1996). A key contribution of this paper is the development of a method of estimating a representative distribution of half lives which is based upon the observed distribution of shocks in a given time series. This approach is implemented with data on four real exchange rates. The results suggest that while NMR may produce half lives lower than the three year benchmark, half lives shorter than two years are relatively uncommon. In the second chapter, the tests of Kapetanios, Shin, and Snell (2003) and Bec, Salem, and Carrasco (2004), which are designed to detect nonstationarity verses globally stationary ESTAR nonlinearity, are extended to allow transition variables with delay parameters greater than one. It is shown that both test statistics have the same asymptotic distribution compared with the case when the delay parameter is equal to one. The application of these generalized tests is illustrated in an empirical exercise using data on a set of 105 real exchange rates and 15 real interest rates. The third chapter investigates the small sample properties of threshold parameter estimation in the self exciting threshold autoregressive (SETAR) model. While it has been shown that the conditional least squares estimator in the SETAR model behaves poorly in general (see Kapetanios, 2000), this paper identifies systematic small sample biases that results when the distribution of observations between regimes is uneven. The importance of this issue is illustrated with Monte Carlo experiments based on estimating ?commodity points? in a law of one price framework. The fourth chapter combines approaches focusing on the role of distance and market heterogeneity to study what factors contribute to spatial violations of the law of one price. Using data on disaggregated cost of living indices for a cross section of 211 cities in the United States, evidence is provided that suggests that not controlling for market heterogeneity could produce misleading estimates of the role of distance on price differentials.

title: Self Adaptive Finite Element Analysis
abstract: From the behavior of steel under thermal loads to the response of organic tissue to various stimuli, engineering research strives to develop constitutive models that allow us to understand and predict the physical world around us. Characterizing and understanding the constitutive behavior of materials is a pursuit limited by the expense and time associated with conducting and interpreting laboratory experiments. The focus of this thesis is to extend the development of an innovative computational method that aims to help circumvent the need for extensive tests as a basis for obtaining accurate and precise material response models.
Specifically, this research involves the Autoprogressive training of Neural Networks for the inverse estimation of heat transport material models. This methodology, the Self Adaptive Finite Element Analysis (SAFEA), combines a Neural Network based Constitutive Model (NNCM) with a nonlinear Finite Element Program in an algorithm which uses very basic conductivity measurements to produce a constitutive model of the material under study: Through manipulating a series of Neural Network embedded Finite Element Analyses,

it is demonstrated that an accurate constitutive model for a highly nonlinear material can be evolved and retained as an object to be used in the analysis of any problem involving the material under study.
This thesis details the theoretical development of the SAFEA algorithm and provides a simulation of the SAFEA program through a steady-state non-linear heat transfer problem. The SAFEA program, coded in MATLAB, is included in appendix.

title: The socioeconomic correlates of HIV/AIDS knowledge and condom use in Madagascar
abstract: We estimate the determinants of HIV/AIDS knowledge and related behavior (use of condoms)among women in Madagascar, a country where prevalence remains low but conditions are ripe for a rapid increase in infections. In both rural and urban areas, more educated and wealthier women are more likely to know about means of preventing infection, less likely to have misconceptions about transmission, and more likely to use condoms. Community factors such as availability of health centers and access to roads also lead to greater HIV knowledge. However, most of the large rural-urban difference in mean knowledge is due not to location per se but to differences in schooling and wealth; rather than simply being geographically targeted, AIDS education efforts must be designed to target and be understood by uneducated and poor subpopulations.-

title: TWINS, THE B/PR55 REGULATORY SUBUNIT OF PROTEIN PHOSPHATASE IIA, IS NECESSARY FOR PHOTORECEPTOR FATE SPECIFICATION AND MORPHOGENETIC FURROW INITIATION IN THE DROSOPHILA MELANOGASTER EYE
abstract: The Ras/MAPK pathway plays an essential role in the development and differentiation of eukaryotic organs. During Drosophila eye development, the cells of each unit, or ommatidium, of the eye are specified from a field of undifferentiated cells. As the morphogenetic furrow passes across the eye field, the Ras/MAPK pathway is reiteratively activated in cells posterior to the furrow to recruit first the eight photoreceptors, then the four cone cells, and finally the pigment cells. Understanding Ras/MAPK?s regulation is essential to knowing how its activation can generate so many cellular outcomes.
The enzyme protein phosphatase 2A (PP2A) is critical for successfully transducing the Ras/MAPK signal. PP2A is composed of three subunits, the associated A and catalytic C subunits compose the core enzyme, and a variable B subunit which regulates the activity of the enzyme. The Drosophila gene twins encodes the B/PR55 regulatory subunit of PP2A. Mutations in twins have previously been shown to affect the development of peripheral sensory organs in the adult fly. Large patches of mechanosensory organs are missing from the thorax of the fly, while those that remain have duplicated bristles and sockets at the expense of the mechanosensors? neuron and sheath cells. Additionally, notal tissue is sometimes transformed to wing at the posterior edges of the notum.
To better understand the role of twins in Ras/MAPK signaling during eye development, a genetic approach utilizing loss of function mutants and ectopic twins expression was used. Hypomorphic twins mutants were missing R7 photoreceptors, cone cells, and had disorganized pigment cells. Furthermore, these twins mutations were found to suppress the egfrE1 mutation, a hypermorphic allele of the Ras/MAPK receptor EGFR. Ectopic expression of twins was able to rescue the morphogenetic furrow inhibition caused by loss of EGFR function, suggesting that twins functions downstream of EGFR in Ras/MAPK signalling.

Additionally, twins suppressed furrow inhibition caused by ectopic wg, but not that caused by the loss of Notch activation, supporting twins role in regulating Ras/MAPK positively. These results suggest that twins is a positive regulator of Ras/MAPK, necessary for a subset of Ras/MAPK dependent ommatidial developmental events.

title: SOCIALISM, GLOBALISM, AND PLAYFUL SABOTAGE
abstract: This dissertation examines four contemporary Chinese artists? selected installations, performances, and video works created from 1993 to 2003. The artists who are the subjects of this dissertation are Xu Bing, Zhang Peili, Yang Zhenzhong, and Xu Zhen. Particular attention is given to several political and cultural phenomena of the time that dramatically show the tension between socialist forces and the emerging capitalist and globalist forces in China. At this moment of great change and socialist appropriation of capitalist and globalist vehicles, a great energy was provided, which inspired a creative dynamism in art. It also shaped the artists? visions in the media used. A common strategy used by these artists was one of playful sabotage, a strategy by which these artists tried to deal with the opposing forces of socialism and consumerism and then attempted to affirm the self in their new world in art.

title: Orthorhombic Gamma-Brasses in the Pd-Cd System: Their Long c Axis and Composite Crystal Description, Chemical Twinning and Atomic Site Preferences.
abstract: This dissertation presents single crystal studies of Pd.213Cd.787 and Pd.235Cd765, synchrotron powder studies of Pd1-xCdx, 0.755 >= x >= 0.800, and LDA-DFT and extended Hueckel (eH) calculations on these or related phases. The two single crystal structures have a, b, and c axis lengths of respectively 9.9013, 14.0033, 37.063 and 9.9251, 14.0212, 60.181 angstroms. Their structures are in respectively Ccme and F2mm (solved as (3+1)-dimensional crystals their most convenient superspace group is Xmmm00gamma)s00). The structures have two different structural components each with their own separate axis parameters. Powder data shows that the ratio of these separate axes, S/L, varies from 1.615 to 1.64, values near the golden mean (1.618). For Pd.213Cd.787, different Pd and Cd site occupancies lead to variation in the R-factor from 2.6-3.6%. The site occupancy pattern with the lowest R-factor (among the 26,820 variants studied) is the exact site occupancy pattern predicted by LDA-DFT parameterized eH Mulliken charge populations. The phases can be understood through a chemical twinning principle found in gamma-brass, the parent structure for the above phases (a relation with the MgCu2 Laves phase is also noted). This twinning principle can be used to account for Cd and Pd site prefences. At the same time there is a clean separation among the Cd and Pd atoms for the two separate chain types at height b=0 and 1/2. These results indicate that Cd:Pd stoichiometry plays a role in phase stability.
The second chapter presents the single crystal structures of Pd.211Cd.789 and Pd.204Cd.796 in an abbreviated form. It explicitly details the results of the synchrotron powder diffraction study in chapter one as well as the 4-dimensional refinements of Pd.213Cd.787 and Pd.235Cd.765. In addition, a variable temperature, synchrotron powder x-ray diffraction study is given for Pd.210Cd.790.This work was funded by the National Science Foundation through grants DMR-007358 and DMR-0504703 as well as the Deutscher Akademisher Austaush Dienst.

title: On the Correctness of Gossip-based Membership Protocols
abstract: The importance of scalability and fault-tolerance in modern distributed systems has led to considerable research in multi-cast protocols using gossip. In a gossip protocol, each node forwards messages to a small set of ``gossip partners'' chosen at random from the entire group membership. By discarding the strong reliability guarantees of traditional protocols in favor of probabilistic guarantees, gossip protocols can deliver greater scalability and fault tolerance. In early gossip algorithms, partners were chosen uniformly at random from the entire membership, limiting scalability because of the resources required to store and maintain complete membership views at each node. Later protocols avoided this issue by storing much smaller random subsets of the membership at each node, and choosing gossip partners only from these local views. Such protocols are subtle: at least some local views must change in response to group membership changes in order to preserve connectivity and performance guarantees. While these protocols have been the subject of much simulation and analysis, formal proofs of key properties - in particular the probability of partitioning - have remained elusive.
In this thesis we give a new scalable gossip-based algorithm for local view maintenance, together with a proof that the expected time until a network partition is at least exponential in the view size and the size of the departing set. We develop probabilistic bounds on the in-degree (hence the load) of individual nodes, and argue that protocols lacking our reinforcement component eventually converge to star-like networks, whose connectivity depends on a small set of overloaded nodes. We argue that the undirected connectivity graph is an expander, for which application-level gossip multi-cast protocols will converge rapidly. An analysis of the membership system under heavy churn yields a lower bound on the amount of communications required per round. Finally, we offer some arguments supporting the experimental fact that the elements of the local

views - although not a uniformly random sampling of the set of nodes in the system - have a high degree of randomness and suggesting that the state of the system after O(ln n) iterations is independent of the initial state.

title: Exploring the Potential of a Virtual Undergraduate Library Collection Based on the Hierarchical Interface to LC Classification (HILCC)
abstract: The Hierarchical Interface to Library of Congress Classification (HILCC) is a system developed by the Columbia University Library to leverage call number data from the MARC holdings records in Columbia's online catalog to create a structured, hierarchical menuing system to provide subject access to the library's electronic resources. In this paper, the authors describe a research initiative at the Cornell University Library to discover if the Columbia HILCC scheme can be used as developed by Columbia, or in modified form, to create a virtual undergraduate print collection outside the context of the traditional online catalog. Their results indicate that, with certain adjustments, a HILCC model can indeed be used to represent the holdings of a large research library's undergraduate collection of approximately 150,000 titles, but that such a model is not infinitely scalable and may require a new approach to browsing such a large information space.

title: Integrated Framework for Discovering Digital Library Collections, An
abstract: Information seekers are generally on their own to discover and use a research library's growing array of digital collections, and coordination of these collections' development and maintenance is often not optimal. The frequent lack of a conscious design for how collections fit together is of equal concern because it means that research libraries are not making the most of the substantial investments they are making in digital initiatives. This paper proposes a framework for a research library's digital collections that offers integrated discovery and a set of best practices to underpin collection building, federated access, and sustainability. The framework's purpose is to give information seekers a powerful and easy way to search across existing and future collections and to retrieve integrated sets of results. The paper and its recommendations are based upon research undertaken by the author and a team of librarians and technologists at Cornell University Library. The team conducted structured interviews of forty-five library staff members involved in digital collection building at Cornell, studied an inventory of the library's more than fifty digital collections, and evaluated seven existing OAI and federated search production or prototype systems. Discusses the author's team's research and the rationale for their recommendations to: present a cohesive view of the library's digital collections for both browsing and searching at the object level; take a programmatic (rather than project-based) approach to digital collection building; require that all new digital collections conform to library-developed and agreed-upon OAI best practices for data providers; and implement organizational structures to sustain the library's digital collections over the long term.

title: Quantitative Prediction of Elastic and Anelastic Phenomena on the Nanometer Scale
abstract: In the past two decades, nanometer scale devices have become increasingly important in various scientific and technological applications such as sensors, actuators and storage devices. This thesis presents a theoretical exploration of some of the vibrational properties of such devices, with an emphasis on quality factor, the fraction of energy lost per period of oscillation in a vibrating system.

The thesis introduces a new method for obtaining the ground state structure of defects by looking at their mechanical response. This method involves calculation of the activation volume tensor of the defect using reliable ab initio techniques. As an application, results are presented for the activation volume tensor of a divacancy in silicon, a defect commonly introduced in the fabrication stages of silicon actuators. Comparison of the activation volume tensor to experimental values leads to an unambigious identification of the ground state of this defect, which has proved elusive in the literature to date. Finally, the calculation of the mechanical energy loss caused by divacancies in a silicon oscillator is given.
The thesis then turns to the calculation of the electronic mean-free path in carbon nanotubes under high-bias. Electron-phonon interactions have been found to have a considerable effect in the determination of the electron mean-free path. We determine the mean-free path of the nanotubes in the presence of various phonon modes that cause scattering of electrons. The thesis concludes with a consideration of the vibrations of suspended nanotubes, exploring first the dependence of the vibration frequencies on such factors as downward force and built-in slack in the nanotube and then turning to a fundamental loss mechanism intrinsic to any system, namely loss due to phonon-phonon interactions.MRSEC program of the NSF(No. DMR-0079992) NSF NIRT program Cornell Center for Materials Research

title: STUDIES ON THE MECHANISMS OF LIGAND-INDUCED NUCLEAR LOCALIZATION OF CELLULAR RETINOIC ACID BINDING PROTEIN TYPE II
abstract: Retinoic acid (RA), a derivative of vitamin A, is well know for its ability to act as a transcriptional modulator, and it is critically involved in a number of cellular processes. The cellular retinoic acid binding proteins (CRABP-I and II) are small cytosolic proteins that bind to RA with a high affinity, and they are thought to play a role in the biological activities of RA. The expression of CRABP-II has been shown to selectively enhance the activity of a group of ligand-inducible transcription factors known as the retinoic acid receptors (RARs), and CRABP-II has also been shown to accumulate in the nucleus in response to RA treatment. CRABP-II is thought to enhance RAR activity by enhancing the movement of RA into the nucleus, where RAR functions as a transcription factor. The question addressed in this work was that of the mechanism by which CRABP-II accumulates in the nucleus in response to RA. Abolishing nuclear localization of CRABP-II, and the resulting effects on RAR activity were addressed. CRABP-II was tagged to a nuclear export signal (NES), which actively excludes a protein from the nucleus. Subsequently, the NES functionality was verified by fluorescence microscopy. Functional assays for RAR activity were performed, and it was determined that accumulation of CRABP-II in the nucleus was necessary for it to enhance the activity of RAR. To address possible mechanisms for the nuclear localization of CRABP-II, analysis of its primary and tertiary structures were performed. No nuclear localization signals could be identified in the primary sequence of CRABP-II. Comparisons of the electrostatic surface potentials of apo- and holo- crystal structures of CRABP-II identified a region of the protein that appeared to become more basic in response to RA binding. Three basic residues in the region were identified as potentially important for the change in the

surface potential. Further analysis identified the residues as being very similar in orientation to a classical primary nuclear localization signal. The three basic residues of CRABP-II were converted to alanines by mutagenesis, and the recombinant mutant was purified from E. Coli. Using the purified WT and mutant proteins, it was determined that mutation of the residues did not significantly change the proteins? sensitivity to urea-induced denaturation, and that the mutations did not significantly disturb the ability of CRABP-II to bind RA. The three basic residues were then mutated in mammalian expression vectors, and the effects of mutating them were evaluated by microscopy. It was determined that the three basic residues are required for RA induced nuclear localization of CRABP-II. Further, it was determined that Leptomycin-B (LMB), an inhibitor of nuclear export, had no effect on the RA-mediated localization of the WT or the mutant protein, suggesting that CRABP-II nuclear localization is mediated by an import machinery. Functional assays for RAR activity were used to address the functional significance of the three basic residues. It was determined that the mutant protein was unable to enhance the activity or RAR to the same degree as WT, and further that the enhancement by the mutant was similar to that obtained using the NES-tagged WT protein. Further research was done to identify the proteins involved with the RA induced nuclear import of CRABP-II. Recombinant CRABP-II-GST was shown to interact with importin?, a known nuclear import-related protein, in an RA dependent fashion. The NLS CRABP-II mutant did not interact with importin? even in the presence of RA, further supporting the hypothesis that RA induced nuclear localization requires the three NLS residues. Overall, this work suggests a unique mechanism for nuclear import, in which a non-classical NLS emerges in CRABP-II in response to RA binding.

title: ROOT DEVELOPMENT AND SOIL NITROGEN AVAILABILITY AS DRIVERS OF MAIZE-WEED COMPETITION
abstract: A mechanistic understanding of crop-weed interaction has been used in dynamic simulation models of the growth of crop-weed mixtures to estimate the outcomes of competition, including yield losses, and predict the effects of management practices. In the case of an annual crop such as maize, when plants in mixtures begin to compete for light during the early growing season, the relative position of the leaves of the crop and weeds determine the light captured by the plant and its subsequent growth and yield. Thus the total area and distribution of leaves, and factors that can change those characteristics will impact crop competitiveness. Below ground resources such as nitrogen or water availability, are thought to be among those factors that influence leaf area and distribution. However due to the complexity of studying competition for below ground resources, little information has been gathered to support this assumption.
The specific objectives of the present study are: i) to characterize early season root system growth for maize and four weed species and to determine the effects of above and belowground maize competition on maize and weed root system development; ii) characterize, in comparison with maize, the early and exponential growth phases of four weed species; iii) identify and quantify the changes induced by nitrogen stress in plant architecture and morphology that could be important in determining weeds and maize success in compete for resources in a mixed maize-weed stand. To achieve the first objective, this study utilized an herbicide injection technique to assess the comparative root geometries and temporal development patterns for redroot pigweed (Amaranthus retroflexus L.) and velvetleaf (Abutilon theophrasti Medic.) in association with maize (Zea mays L.); and redroot pigweed, velvetleaf, maize, common lambsquarters (Chenopodium album L.) and giant foxtail (Setaria faberi Herm.) in monoculture. The second and third objectives were addressed in a separate glasshouse experiment where maize, A. retroflexus, A. theophrasti, S. faberi and C. album where grown in sand culture at varying soil solution nitrogen levels (0.2, 0.5, 2, 5 mM L-1 NO3).
Root system vertical and lateral growth was more variable among species than between different soil types,

suggesting that root development in the absence of important soil physical impediments is a plant intrinsic characteristic. For A. theophrasti and A. retroflexus, root system volume was proportional to plant above-ground biomass. Thus, plants growing under a competitive environment and having reduced above-ground biomass have a proportionally smaller root system, potentially compromising their ability to capture and compete for soil resources with their neighbors. This study also provides insights into the likelihood of belowground competition occurring between plants based on the likelihood of root system overlapping and exploring the same soil regions. Increasing levels of soil nitrogen significantly increased relative above-ground plant biomass in a similar fashion for maize and the three broadleaf weeds, but S. faberi was comparatively unresponsive to higher levels of soil nitrogen. Diverse growth sensitivities to soil nitrogen may in part explain the variability of competitive relationships commonly observed under field conditions. Our results demonstrate that species do not respond uniformly to changes in soil nitrogen status and those differential responses must be addressed when considering the impact of soil fertility on competitive outcomes in agricultural systems. Furthermore, the root development study indicated that the chance of a crop-weed mixture exploiting a common region of soil or finding an enriched patch of soil are low at the early growth stages, suggesting that localized differences in nitrogen availability could drive the competitive relationship in favor of the crop or the weeds.

title: Engineering: Cornell Quarterly, Vol.06, No.3 (Autumn 1971): Capstones of Century I
abstract: It was a small class, this first one in engineering at Cornell University, but the seven Bachelors of Civil Engineering who graduated in June of 1871 were the vanguard of 25,000 Cornell engineers who have contributed to the technological development of the United States and the world during the past one hundred years. The story of this century of engineering education is a part of the history of a great institution, a compound of noble ideas, imaginative leadership, commitment, hard work, philanthropic support -- and a bit of luck from time to time. The record of engineering at Cornell is long and distinguished, and what follows represents only a quick brush stroke over a century of progress.

title: COLLOIDAL CDSE/ZNS, PBSE AND PBS QUANTUM DOTS FOR USE IN APPLICATIONS
abstract: DissertationColloidal semiconductor quantum dots are novel materials whose electronic and optical properties can be greatly enhanced from the bulk semiconductor properties by quantum confinement. A brief introduction to colloidal quantum dots and the effect of size on its electronic and optical properties will be given. CdSe/ZnS, PbS, and PbSe quantum dots will be described in more detail with regards to the research done in this dissertation. CdSe/ZnS quantum dots have luminescence that can be tuned in the visible, making them particularly suited for fluorescent labels in biological applications. In particular, their potential use as voltage sensors to detect cell membrane potentials and sphingosine phosphorylation will be discussed. PbS and PbSe quantum dots emit in the near infrared, wavelengths that are important to telecommunications. Their small third-order nonlinearity and relatively long (microsecond) lifetimes will

be discussed in terms of dielectric screening. Fluoresence resonant energy transfer between PbS quantum dots will also be discussed.

title: eJournal interface can influence usage statistics: implications for libraries, publishers, and Project COUNTER.
abstract: The design of a publisher's electronic interface can have a measurable effect on electronic journal usage statistics. A study of journal usage from six COUNTER-compliant publishers at thirty-two research institutions in the United States, the United Kingdom and Sweden indicates that the ratio of PDF to HTML views is not consistent across publisher interfaces, even after controlling for differences in publisher content. The number of fulltext downloads may be artificially inflated when publishers require users to view HTML versions before accessing PDF versions or when linking mechanisms, such as CrossRef, direct users to the full text, rather than the abstract, of each article. These results suggest that usage reports from COUNTER-compliant publishers are not directly comparable in their current form. One solution may be to modify publisher numbers with 'adjustment factors' deemed to be representative of the benefit or disadvantage due to its interface. Standardization of some interface and linking protocols may obviate these differences and allow for more accurate cross-publisher comparisons.

title: The Ontogenesis of Metaphor: Riddle Games among Quechua Speakers Seen as Cognitive Discovery Procedures
abstract: The research for this paper was conducted in the Department of Ayacucho during 1975 and 1976 under the sponsorship of The National Institute of Mental Health grant number MH26118-02 and a grant from the Social Science Research Council. Billie Jean Isbell is responsible for the theoretical formulations in the paper, which she wrote in English. Fredy Amilcar Roncalla Fernandez, the coauthor, collected nearly all of the data. He is a native speaker of Quechua and without his native intuitions and careful translations, this paper would not have been written.Metaphor, it is argued, plays an important function in cognitive and

semantic development of Quechua-speaking children who engage in riddle games. It appears that riddling among the Quechua functions as a discovery procedure as children expand their cognitive operative structures and semantic domains.The National Institute of Mental Health grant number MH26118-02; Social Science Research Council

title: Japanese Performing Arts Resource Center, September 2005
abstract: To view this archival copy of the site, download the zipped folder, extract the files, and open the "index.html" file in a browser.This is an archive copy, from September 2005, of the Japanese Performing Arts Resource Center prototype.

The Global Performing Arts Consortium (GloPAC) is beginning to develop Performing Arts Resource Centers (PARCs), which combine scholarly content with technological sophistication to create interactive, innovative, and interpretive Web-based learning environments designed to advance the teaching and study of the performing arts. Each PARC will have a specific focus, which may be geographic (Japan), temporal (turn of the 20th century), ethnic (Afro-American), thematic (feminist theatre), or audience oriented (teens). The resources on these sites will use individual materials that are stored and fully described in the Global Performing Arts Database (GloPAD), which will provide further opportunity for contextual research.

The Japanese Performing Arts Resource Center (JPARC) contains resources for the study of the traditional theatres of Japan and is GloPAC's initial prototype PARC. It was originally developed in 1999 by Karen Brazell, GloPAC Director and Goldwin Smith Graduate Professor of Japanese Literature and Theatre at Cornell University; Monica Bethe, GloPAC consultant and Professor at Otani University, Tokyo; and Cornell student assistants Tang Fang '99, architecture; Mien Wang, BFA '99 in painting and printmaking; and Thomas Lento '00, Asian studies. Joshua Young and Kumiko McKee, GloPAC Research Associates, have added to and edited certain pages within the site since its initial set up.

JPARC currently includes an interactive play script, a digital video of a biwa performance, a dynamic slide show on costuming, and a 3-D noh stage, as well as a multi-layered glossary and an index of translations, and primarily focuses on noh theatre at this time. An advisory committee has been formed to develop a more sophisticated JPARC, one that incorporates more advanced technologies, in-depth scholarly content, and Japanese performance genre.This JPARC copy and the archiving of it was made possible through the support of Atlantic Philanthropies by way of a grant administered by J. Robert Cooke, Cornell University professor of biological and environmental engineering.

title: The Influence of Climate and Tectonics on the Geomorphology of the Western Slope of the Central Andes, Peru and Chile
abstract: This thesis explores the geomorphic evolution of the western Andean mountain front with respect to climate and tectonics for the area between 10?S and 33?S latitude. Much of the area I studied lies within the Atacama Desert, the most arid environment known on earth today.

The development of a disequilibrium (or polyphase) landscape between 18?S and 22?S with the youngest phase of landscape development dominated by deep canyons suggests a progresson through time toward conditions favoring the development and preservation of groundwater sapping features. I interpret the shift to be related to uplift of the adjacent Altiplano Plateau, with consequent reduction in precipitation on the western Andean slope. In support of this, an estimated 1000 m of post-10 Ma uplift of the central Andes is determined by modeling the former downstream projections of knick-point bounded river segments in the rivers draining the area between 18? and 22?S (Northernmost Chile).

The impact of climate on landforms is explored in detail by the relationships between mean annual precipitation (MAP), slopes measured from a 90 m DEM, and erosion rates. At the scale of the entire mountain front, there is a significant correlation between average slope at the hillslope scale and the modern climatology of the western Andean Mountain front between 10? and 33?S latitude. Detailed examination of the distribution of slopes at the hillslope scale for eight distinct mountain front regions reveal the consequences of allochthonous versus autochthonous mountain front moisture sources. At Approximately 100 mm/yr mean annual precipitation, slope distributions begin to reflect the dominance of fluvial landscapes. Reconstruction of a regionally extensive ~ 10 Ma depositional surface permitted the determination of erosional mass loss for the rivers that drain the western mountain front. Erosion rates were determined for 2 areas, on in a zone with a pronounced vertical precipitation gradient (18?S-22?S) and the other in an area with a strong latitudinal precipitation gradient (25?S-29.5?S). Landform data for the southern region show strong correlations between MAP, average slope and erosion rate. The northern area does not have strong correlations most likely due to the strong impact of allochthonous water sources.National Aeronautical and Space Administration Earth System Science Fellowship; National Science Foundation EAR-0208130

title: AMBIGUITY AND ANXIETY IN THE PROCESSING OF HEALTH RISK MESSAGES
abstract: This study looks at the effects of manipulating the ambiguity of health risk messages on worry and perceived susceptibility. In view of literature that indicates robust emotion-congruent effects of anxiety on the interpretation of ambiguous information, a procedure was used to manipulate levels of state-anxiety for a treatment group.

Fifty-two participants completed an experimental task involving the reading of six health risk messages on different topics. Each message was followed by a short questionnaire to assess levels of worry, risk perception and attributional confidence. In addition, the participant?s familiarity with the message as well as his/her risk profile for the particular health risk in the message was assessed to provide context for their response to the messages. The experiment followed a 2 (within-group variables, ambiguous vs. unambiguous) x 2 design

(between-group variables, state-anxiety induction vs. control group).
It was hypothesized that anxious readers would report higher worry than non-anxious readers, and that worry would be higher for disambiguated messages. Results indicated partial support. A significant interaction effect was found between state-anxiety induction and ambiguity, such that high state-anxious readers reported higher worry than non-anxious readers, for unambiguous messages only.
It was also hypothesized that risk profile information would predict worry. This hypothesis was supported.

title: Immigrants and the Community: Former Farmworkers
abstract: Many upstate New York communities have experienced population loss and decline in the last decade. Increasing numbers of immigrants have settled in many of these communities, which poses possible community development challenges and opportunities. As we reported earlier (Immigrants and the Community: Farmworkers with Families), a growing proportion of farmworkers with families is settling in rural communities. This trend may create both opportunities and problems for rural communities, but how can we anticipate what those might be? In an effort to understand the integration of new immigrants into rural communities, we interviewed former farmworkers and other community members in five upstate townships. A look at the experiences of former farmworkers who have resided in the community for some time can provide some valuable insights. Because each community must address these issues in its own way, this report is intended to make communities aware of changes in their populations and highlight issues they may choose to address.
Description: Third in a series based on the research project "Integrating the Needs of Immigrant Workers and Rural Communities," which attempts to inform New York communities about the nature and consequences of increasing immigrant settlement.

title: Immigrants and the Community: Community Perspectives
abstract: As related in our previous reports, the populations of many rural New York communities are becoming more ethnically diverse. This diversification became especially noticeable in the 1990s with the upsurge in Mexican migration. When agricultural production is found in or near communities, immigrants often first come there as farmworkers. As indicated in our previous report, our research has shown that after a fairly short time (less than 10 years), many of the workers leave seasonal farm employment for more steady work in agriculture or other industries. For these workers a departure from agricultural employment often does not mean that they leave the communities where they work. In fact, many of them told us they would like to settle here provided they can find work. The increasing tendency for Mexican immigrants to settle in the U.S. has been observed in many regions and in urban as well as rural areas. Diversifying communities are faced with a range of opportunities and challenges associated with this population change. However, this situation may be a source of confusion in communities that have only recently experienced increased immigrant settlement. The purpose of our study has been to document changes associated with the ethnic diversification of rural communities and to provide a factual foundation for community deliberations about how to capture opportunities and address challenges associated with this population change.
Description: Fourth in a series based on the research project "Integrating the Needs of Immigrant Workers and

Rural Communities," which attempts to inform New York communities about the nature and consequences of increasing immigrant settlement.

title: Changing the bargain: The stability and change of centralized wage bargaining in open liberal economies
abstract: The methodology used in the dissertation is a paired comparison of Ireland (?Social Partnership? 1987-2005) and Australia (?The Accord? 1983-1996), with reference to other cases of central wage bargaining in liberal economies. The primary research question is, what explains the stability of Irish central wage bargaining in comparison to the decentralization of wage bargaining experienced in Australia in the late 1980s and early 1990s?

There are two conditions that must be sustained in order that central wage bargaining is stable in open liberal economies. First, public sector wages must be kept under strict control and large wage drift must be avoided. Second, export sector employers must be able to exercise pay flexibility. Pay flexibility is defined as encompassing an outcome dimension (exporters should be allowed to give pay increases above or below the centrally agreed wage bargain increase) and a process dimension (exporters should be allowed to set wages with a minimum of interference from third parties, be they wage setting institutions or trade unions).

The two necessary conditions of public sector wage control and export sector pay flexibility are found in the Irish case explaining central wage bargaining stability, but not in the Australian case, explaining its wage bargaining decentralization. In Ireland after 1987, the stability of the system has been enabled by a concerted effort by policy-makers to de-couple pay movements between the public and export sectors. This is achieved through allowing export employers pay flexibility, while ending old patterns of public sector relativities-driven wage bargaining. This is in contrast to the late 1970s and early 1980s where large public sector wage drift caused the decentralization of wage bargaining. The Australian system decentralized because wage arbitration institutions created during a closed trade policy regime interfered with the process aspect of pay flexibility of exporters. These institutions intruded into wage setting at the plant level, and enhanced the power of trade unions to influence and alter the wage setting process. This provoked a successful export-employer led offensive on the central wage bargaining system.

abstract: IN THIS ISSUE: Toward a National Program for Energy Research and Development: A Report on the Cornell Workshops /2 (Groundwork for the government's announced $10 billion program was laid at the Cornell Workshops on the Major Issues of a National Energy Research and Development Program, held in Washington last fall under auspices of the Atomic Energy Commission. A summary article reports on the findings and recommendations of some eighty leadingexperts from government, industry, research organizations, and the universities.) ... The Hydrogen Economy: Solution to the Energy Problem? /13 (Prospects for the future of hydrogen as the basis of a national energy-supply system are analyzed by Simpson Linke. professor of electrical engineering, who organized the Cornell International Symposium and Workshop on the Hydrogen Economy, sponsored by the National Science Foundation and held last summer on the campus.) ... The Environmental Impact of Nuclear Energy /23 (The quantitative assessment of nuclear hazards is discussed by K. Bingham Cady, associate professor of nuclear science and engineering, who advocates the inclusion of

biological and environmental as well as production costs in analyses of energy producing industries. Cady, a specialist in nuclear physics and engineering, participates research connected with the Cornell Energy Project, which is sponsored by NSF/RANN.) ... Commentary /34 (Issues and options of energy policy were explored by representatives of governmental, industrial, and research groups in a spring lecture series sponsored by the College of Engineering.) ... viewed: 3829
title: A History of the Warfare of Science with Theology (Vol.1)
abstract: This extraordinary and scarce work by Andrew Dickson White (1832-1918), a professor and co-founder of Cornell University, is a unique study of the progress of humankind under two duelling forces: theology and science. White traces the evolution of human thought through a series of contrasts of ancient

and modern theories of the world to show the impact of scientific research on the outmoded attitude of biblical literalism. Taking in an enormous range of subjects--including geography, astronomy, geology, chemistry, physics, medicine, psychology and economics--White illustrates the victory of empiricism over superstition, of scientific method and 'reason' over fundamentalism. White's aim was to show that the Church's attacks on scientific progress resulted in 'the direst evils both to religion and to science' and, more broadly, his study points up the dangers inherent in the religious control of higher education (at a time when nearly all universities in the USA and Europe were still under ecclesiastical control). Cornell University was established on the principle that education should not be under the control of political parties or religious sects--an idea greeted at the time with hostile accusations of Darwinism and atheism. But White was in fact deeply religious and his hope was to strengthen and purify theology by eliminating its antiscientific concerns. This excellent treatise finds special relevance today when academic freedom is once again under pressure from political and religious groups. It should now find a place in the libraries of all theologians, philosophers and historians.

title: Engineering: Cornell Quarterly, Vol.13, No.3 (December 1978): Planets and their Satellites
abstract: IN THIS ISSUE: Exploring New Worlds in Space: The Other Moons /2 Joseph A. Burns, associate professor of theoretical and applied mechanics, and Joseph Veverka, associate professor of astronomy, discuss what has been learned about the natural satellites of the solar system and what may be anticipated from the Voyager and Galileo missions.) ... Phobos: A Captured, Fractured Asteroid? /11 (A Cornell Ph.D. dissertation in geological sciences, a photointerpretive study of Viking Orbiter pictures of the moons of Mars, is the basis of this article. Peter Thomas, now a research associate at Cornell's Center for Radiophysics and Space Research, wrote the thesis; Arthur L. Bloom, professor of geological sciences, was chairman of his graduate committee.) ... Clues to an Understanding of Volcanism /18 (Studies of volcanism on Earth may profit from comparative studies of volcanism on other planets and their satellites, as well as on Earth's Moon, according to Donald L. Turcotte, professor of geological sciences.) ... Cold Skin and a Warm Heart: A Model for Earth's Moon /26 (Arthur F. Kuckes, professor of applied and engineering physics, explains his study of magnetometer data obtained in the Apollo program, and his conclusions about convection in the Moon.) ... Register /33 ... Vantage /41 (Engineering strength in soccer and football is recognized in a prejudiced look at this year's Cornell teams.) ... Faculty Publications /44

abstract: IN THIS ISSUE: Perspectives in Geotechnical Engineering /2 (A Cornell graduate, Robert L. Schiffman, takes a broad view of his specialty field. He is now professor of civil engineering at the University of Colorado at Boulder.) ... Foundation Engineering: New Skills in an Ancient Art /7 (Rock, soil, and seafloor sediment present different problems in foundation engineering. Fred H. Kulhawy, associate professor at Cornell, discusses how the field is responding to the requirements of larger and more specialized structures.) ... Marine Geotechnology: Adventure in Engineering /13 (Underwater projects, including offshore oil and mineral extraction, place heavy demands on geotechnical engineers. The challenge is described by Dwight A. Sangrey, a Cornell professor in the geotechnical engineering area.) ... Engineering Geology: A Combination of Inseparable Fields /21 (Study in geology (at Cornell) and civil engineering prepared Richard E. Goodman for work in his specialty field of engineering geology. A professor at the University of California at Berkeley, Goodman wrote this article while he was a visiting professor at Cornell last fall.) ... Fracture Mechanics: A New Tool for the Geotechnical Engineer /26 (Geotechnical engineers may have to induce rock fracture or contend with it; in either case, they need a basic understanding of fracture mechanics, explains Anthony R. Ingraffea, assistant professor in Cornell's Department of Structural Engineering.) ... Soil Stabilization: An Answer to Shortages of Road-Building Materials /31 (Agricultural engineering professor Lynne H. Irwin, leader of Cornell's Local Roads Program, explains how soil stabilization techniques can improve the performance and durability of low-volume roads.) ... The Shaping of a Discipline /37 (An historical perspective of the development of geotechnical engineering at Cornell is presented by Thomas D. O'Rourke, who received his undergraduate education in civil engineering here and recently joined the faculty as an assistant professor.) ... Faculty Publications /44

title: The What, Where, Why, and How of Institutional Repositories
abstract: This presentation was made at the Hawaii Library Association Conference, Nov. 11-12, 2005, Fairmont Orchid Hotel, Kohala Coast, Hawaii, HI see http://www.hlaweb.org/conference2005/ for more information and the conference program.In this talk I present a general definition of an institutional repository and proceed to discuss several instances of them at various institutions. We'll view them as responses to the crisis in scholarly communications, as ways to promote student and faculty research, and we'll discuss the way faculty view such repositories. Following that I'll discuss two such repositories at Cornell and we'll also look at arXiv.org, focusing on why the latter disciplinary repository is so wildly successful and the former two significantly less so. We will also look specifically at CUL's implementation of DSpace and discuss factors such as acceptance, use, implementation, and costs and what they may imply for the use of institutional repositories at other institutions.

title: Facade
abstract: Facade is an artificial intelligence-based art/research experiment in electronic narrative - an attempt to move beyond traditional branching or hyper-linked narrative to create a fully-realized, one-act interactive drama. Integrating an interdisciplinary set of artistic practices and artificial intelligence technologies, the creators have completed a five year collaboration to engineer a novel architecture for supporting emotional, interactive character behavior and drama-managed plot. Within this architecture the creators have built a dramatically interesting, real-time 3D virtual world inhabited by computer-controlled characters, in which the player experiences a story from a first-person perspective. Facade was publicly released as a freeware

download / cd-rom in July 2005.

title: Development of a Drug Delivery System with a Constant Rate of Release
abstract: You do not have to search long to find someone who is taking orally administered medication on a daily basis. Pharmaceuticals such as antibiotics and pain relievers help us live healthier lives; however the administration of these drugs is more involved than simply the swallowing of a pill. Maintaining a constant level of drug in the body is an important requirement for a variety of medications. The more constant the rate of drug release from a pill, the more effective the drug will be. Our model will compare different crater geometries to demonstrate the effect of crater shape on the release rate of a drug under human body conditions. Our objective is to achieve a constant rate of drug release from a pill. Analysis will demonstrate and allow us to conclude that a hemispherical crater geometry is best to accomplish this objective. We were able to achieve a fairly constant rate of release after approximately 17 minutes and this situation would be beneficial for many pharmaceuticals compared to other, less constant drug delivery systems.

title: Incubating Open Journals in Economics
abstract: As open journals become intellectual successes, they will come to substitute for subscription-based journals. The entry of two new journals specializing in economic theory, one a commercial subscription journal and the other an open journal, stimulates the question: What does a new journal require in order to achieve intellectual impact? Regressing the ISI Impact Factor for 141 journals on attributes of the journals estimates their relative importance. The intellectual reputations of the editors and of the authors? prior work along with the number of libraries that hold the title are positively associated with the journal?s Impact Factor. Using the attributes of the new journals in the estimated relationships yields a forecast of the Impact Factor for the new journals. An open journal has the advantage of being immediately as accessible everywhere on the Internet as though held by many libraries. Its forecast impact is comparable to the journals with the highest impact in this specialty. Some open journals are able to attract outstanding editors and authors with the natural advantage of universal access without charge.Vanderbilt University Nashville TN 37235-1819 Malcolm.Getz@Vanderbilt.edu

title: De inmaduro a duro: lo simbolico femenino y los esquemas andinos de generoFrom Unripe to Petrified
abstract: My motivation for writing this chapter is to call attention to a 'Feminine Symbolic' that I believe constitutes the core of Andean conceptualizations of gender. The argument that I will present is as follows: The feminine, as an abstraction, is an unmarked category, whereas the masculine is elaborated, or marked. In addition, androgyny is a primary force in the continual recreation and reproduction of the world motivated by female sex and desire, not by biological reproduction. Such a gender schema provides an alternative to Lacan's symbolic which makes patriarchy seem inevitable. The second half of this analysis deals with ethnographic materials largely drawn from my fieldwork in the village of Chuschi, department of Ayacucho, Peru in the 1970's. I examine gender formation along the life course and into the after-life.

title: Equine colic
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 1977.
Includes bibliographical references (leaves 17-18).The term colic refers to pain in the abdominal cavity. The pain may originate in the digestive organs, or in other organs; it may be caused by a variety of pathological changes which develop from different generalized diseases. The original meaning of the term colic was pain caused by a spasm in the colon. (Delahanty, 1967) However, usage has widened the definition to include pain arising from the stomach and other digestive visera, and even pain which may be observed during the course of other generalized and infectious diseases.
The general heading of colic is often classified into four major divisions: 1. gastric dilatation 2. spasmodic 3. impaction and 4. pathological displacements of the intestine. Examples of this last division may include: volvulus, herniations, intususceptions, and stenosis of the lumen of the bowel by external bands or foreign bodies. Animals with such pathological displacements are often presented as possible surgical candidates. It is the intent of this paper to present a method of evaluating a colic case in order to determine the need for surgery.

title: A case of unilateral renal lymphosarcoma in a cat
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 1978. Includes bibliographical references (leaf 6).Feline lymphosarcoma is the most common neoplastic disease affecting cats. The clinical manifestation of the disease is extremely variable but it will generally appear in one or more of four pathological patterns: mediastinal, multicentric, abdominal, or leukemic form.
The abdominal form of lymphosarcoma may involve mesenteric lymph nodes, the terminal ileum, liver,

spleen, or kidneys. Cats with the renal form of lymphosarcoma usually have severe involvement of both kidneys.12 Investigators at the Angell Memorial Animal Hospital in Boston corroborate the invariability of bilateral kidney involvement.
The following report presents a case of unilateral renal lymphosarcoma in a cat. The case was unique in that the disease was amenable to surgical Intervention.

title: Captive breeding of exotic animals
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 1981.
Includes bibliographical references (leaves 12-14).Captive breeding of exotic animals has become the primary goal of most zoological parks today. This is due to increasingly stringent export laws which make it difficult to bring certain species from their countries of origin/and, even more importantly, to the growing number of endangered species whose natural habitats are being destroyed. A discussion of general considerations in long term breeding programs is presented, followed by several examples of successful natural breeding programs in captivity. Artificial breeding techniques, Including electroejaculation and artificial insemination, are discussed. Problems with breeding programs, such as inbreeding depression, are illustrated.

title: People, pets, problems : social work aspects of the veterinarian-client relationship
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 1983.
Includes bibliographical references (leaves 23-25).Through a recent surge of interest and research, society has begun to discover and recognize the meaning and significance of the human?companion animal bond. Knowledge gained concerning the intense and involved relationships between owner and pet has placed new significance upon the role of the veterinarian in maintaining and improving human mental, physical, emotional, and social health and well?being.
The purpose of this manuscript is to review those aspects of ?veterinarian-client? relations that emphasize specifically those situations encountered by the veterinarian in dealings with owners distressed over their pet?s medical condition or death. The nature of the veterinarian?s contribution to human health will be explored by briefly examining the dynamic relationship between veterinarian, pet and pet owner. Case studies will be presented to exemplify and clarify problem situations, and examples of intervention efforts on the part of the veterinarian will be discussed.

title: The repair of severely comminuted long bone fractures using stored cortical allografts in conjunction with fresh cancellous autografts
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 1987. Includes bibliographical references (leaves 14-17).High velocity type injuries to the diaphyseal region of the long bones can often result in the literal explosion of the bone into numerous small fragments. Efforts to anatomically reconstruct such severely comminuted fractures, using only the traditional means of internal fixation, usually requires lengthy and difficult surgery which, in turn, increases both the anesthetic risk and the chance of post?operative infection.
Alternative methods have been used in an effort to simplify and shorten the repair of such fractures. One such method involves the use of a full thickness cortical allograft to actually replace the shattered section of bone. This allograft is then coupled with cancellous autografts to help stimulate both new bone formation and the incorporation of the cortical graft by the host.
An allograft is, by definition, a tissue which is removed from one animal and subsequently implanted into another animal of the same species. Allografts are often collected at the time a donor animal is available and can then be preserved and stored until required for use. An autograft, on the other hand, is obtained from a donor site within the recipient?s own body and is collected just prior to implantation at the recipient site.

title: Correction of left displacement of the abomasum using a percutaneous bar suture (""toggle pin"")
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 1987.
Includes bibliographical references (leaves 13-14).Left displacement of the abomasum (LDA) is an economically important condition commonly encountered by the dairy practitioner. Abomasal displacement was either not present or not diagnosed prior to the early 1950?s, when the first reports appeared. The risk of developing an

LDA is greater in highproducing cows from intensively managed herds, adding LDA to the list of production diseases that plagues the modern dairy cow. The incidence in problem herds may range as high as 20%, and in 80% of cases, affected cows have calved within the past month.

Despite the frequency of occurrence of LDA, its precise etiology remains unclear. The four most popular theories regarding its etiology are: the dietary theory, which correlates a high concentrate, low fiber diet with depression of rumen contractions and eructations as well as increased rurnen acidity, all of which predispose to LDA; the mechanical theory, in which the elevation of the rumen by the pregnant uterus is proposed to allow the abomasum to shift ventrally and leftward, becoming trapped on the left when parturition produces a sudden topographic change in the abdomen; the genetic theory, which argues that genetic seictiori for broader, larger dairy cows has produced animals more prone to LDA development due to greater abdominal capacity; and the hypotonia/atonia theory, which is the most comprehensive and includes the important and generally well? accepted dietary theory. The hypotonia theory maintains that any cause of dcreased abomasal tone can predispose to displacement.

title: The effect of exogenous bovine somatotropin on dairy cattle health
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 1990.
Includes bibliographical references (leaves 10-13).The commercial use of bovine somatotropin to increase commercial milk production is a very controversial topic. Concerns have been raised that bovine somatotropin use will adversely affect cow health. Increased incidence of ketosis, increased incidence of milk fever, increased susceptibility to infectious diseases, chronic wasting and infertility were predicted clinical problems resulting from long-term BST use. This review examines the impact of BST on cow health by reviewing clinical health data from twenty-seven bovine soinatotropin production studies. Cows in bovine somatotropin treatment groups had no increased incidence of ketosis or milk fever. Milk somatic cell counts in BST treated cows did not differ significantly from controls. Bovine somatotropin treated animals, like genetically superior high producing cows, had an increased mobilization of body reserves to support increased milk production and reduced reproductive performance.

Notes: Senior seminar (D.V.M.)--Cornell University, 1990.
Includes bibliographical references (leaves [10-11]).The raccoon (Procyon lotor) is a member of the Procyonidae family. This group comprises nine genera and eighteen species including the ring?tailed cat (Bassariscus astutus), the central american cacoinistle (Jientinkip suinichrasti), the coatimundi (Nasua nasua), the raccoon (Procyon lotor), the mountain coati (Nasuella. 0. olivacea), the kinkajou (Potus flavus), the olingo (Brassaricyon gabbii), the lesser panda (Ailurus fulgens), and the giant panda (Aliuropoda inelanoleuca).

Widely distributed throughout North America, the raccoon?s range encompasses southern Canada, most of North America and parts of Central America. For habitat, it prefers heavily wooded areas and dense underbrush where it makes dens in trees near sources of water. The encroachment of man on its natural habitat has not significantly effected the raccoon, which can also be found in abundance in suburban and

urban settings feeding on garbage and living in attics, chimneys, parks and cemeteries.
The raccoon is a nocturnal omnivor feeding, in the wild, on a variety of fish, frogs, small mammals, fruits, berries and seeds. Adults range in weight from 1.5 to 22 kg, attain a head- body length of 41.5 to 60.0 cm, and shoulder height of 25.5 to 30.4 cm. The breeding season lasts from January to June. Litter size ranges from one to seven cubs with an average of three to four.

title: Cervical vertebral instability in a Tennessee walking horse
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 1991.
Includes bibliographical references (leaves 10-11).Cervical vertebral instability is a disease of young, rapidly growing horses of any breed which results in dynamic compression of the cervical spinal cord causing weakness and ataxia in all four limbs. Nutritional, genetic, biomechanical, and traumatic factors may all contribute to the development of the disease. Surgical stabilization of the affected intervertebral joint is helpful in selected cases, with improvement evident in most horses within one year.

title: Natural Climate Change:A Geological Perspective
abstract: A presentation to the
Seminar on Sustainable Development
NBA 573, BEE 673
Sage Hall B-11If the 4.6 billion years the earth has been in existence is one day of geologic time, all of recorded earth history corresponds to the last one tenth of one second of that day- hardly enough time to form an opinion of what is going on in the room in which you are sitting, and hardly a good basis for forming a perspective on climate change. Geology provides the needed perspective. From direct evidence (glacial striations, ice-rafted drop stones, changes in pollen, ice cover, and sea level) and indirect evidence (changes in the isotopic composition of sediments and ice, and in the dust content of polar ice) geologists infer that the earth may have been alternatively completely frozen (-50C) and very warm (+50C) in Late Proterozoic time (800-600 million years ago). Thereafter the earth was warmer than present except for "ice ages" in Pennsylvanian and Permian time (~320-250 million years ago) and in the Quaternary (last 4 million years). Before the last decline in global temperature, England had a climate similar to that of Indonesia. Fossils of crocodiles and broad leaf tropical plants are preserved in the Eocene (40 million year-old) clays there. Continental glaciers developed in Antarctica ~34 million years ago and in Greenland ~8 million years ago. Starting about 2 million years ago continental glaciers periodically covered North America and Europe. Each glacial cycle was ~120,000 years in duration: 100,000 years of ice growth (ice-house conditions) and 20,000 years of warmer, interglacial, green-house conditions. The end of each interglacial was abrupt. The last glacial cycle started about 130,000 years ago. Ice reached Ithaca, New York about 45,000 years ago. At its maximum extent the ice reached to Long Island, and there was ~ 1 mile of ice over Ithaca. The ice age ended abruptly ~12,000 years ago and the last ice melted in Canada ~5,500 years ago. Our interglacial has probably been more uniform in temperature than previous interglacials, but non-the-less there have been significant and rapid climate changes within it. It was warmer than present during the Holocene Maximum (7000-4000 years ago) and during the Medieval warm period (1000-1400 AD), but colder that present during the Little Ice Age (1400-

1860) when the Dutch skated on their canals and Washington and Jefferson commuted to Washington D.C. by sleigh. Recent geological studies suggest that recent minor climate changes (last 12,000 years) are caused by changes in solar energy output. These natural climate changes provide a context for discussing changes that might be caused by humans and for what can be meant by "sustainable". Of course climate change is real (40 million years ago England had the climate of Indonesia, but in the last few million years it has been subject to ice ages interspersed with interglacials). Human activity may be a factor, but other factors also operate. If we are to take out insurance (by controlling greenhouse gases, for example), we should consider what we wish most to insure against (another ice age or global warming) and how much we are willing to pay. My recommendation is to make commitments deliberately, wait for scientific clarification (which will come quickly), and avoid politicizing science. Objective science will be our best long-term protection.

title: Self-Conceptions and Practical Reasons
abstract: The aim of this project is to make sense of the relationship between practical reasons and self-conceptions (i.e. descriptions that an agent believes to be true of herself or is working to make true of herself). To achieve this aim, I have organized this project around three goals: (1) to offer a precise statement of the relationship between self-conceptions and practical reasons, (2) to describe the nature of this relationship, and (3) to examine its implications. I begin by surveying attempts by Christine Korsgaard and Harry Frankfurt to describe this relationship. After critiquing their views and presenting an account of normative reasons that ties them to desire-independent values rather than desires, I argue for the following conclusions. First, this relationship is one of mutual implication. According to this view, that one has certain normative reasons for action makes it appropriate for one to hold certain self-conceptions, and conversely, that one holds a

self-conception of a certain sort (namely one that is true or characteristically associated with activities that promote objective values) entails that one has certain normative reasons for acting. The upshot is that every time an agent acts for a normative reason, we can say something interesting about the relationship between this reason and her self-conceptions (since either the reason will be grounded in an antecedent self-conception, or the reason will have important implications for the appropriateness of holding certain self-conceptions).
Second, our intuitions that there is an important relationship are explained by the fact that there is a conceptual connection between practical reasons and categories of possible respondents to them, whereby all practical reasons must be understood as addressed to agents falling under certain descriptions. This claim is itself implied by the view that reasons are essentially functions relating agents under certain descriptions to the world of possible actions. Third, this conceptual necessity has a number of interesting implications. For example, attending to the connection between its terms opens new avenues for (a) evaluating proposed actions, (b) streamlining the deliberative process, (c) justifying the practice of grounding moral claims in appeals to self-conceptions, and (d) realizing important values.

title: Interface formation and thin film deposition for molecular and organic electronics
abstract: Organic materials are playing an increasing role in modern microelectronic devices-beyond their traditional role as photoresists. Emerging applications such as low-? dielectrics, semiconductors and components in molecular electronics demand excellent control of the interface between organic and inorganic materials. To date, almost all work concerning the formation of inorganic-on-organic structures on pre-existing organic layers has involved elemental evaporation of metal thin films. An alternative approach has been examined via the reaction of an organo-transition metal complex, tetrakis(dimethylamido)titanium, Ti[N(CH3)2]4, with self-assembled monolayers (SAMs) terminated by -OH, -NH2 and -CH3 groups, using X-ray photoelectron spectroscopy (XPS). This is the first detailed study which clearly correlates the reactivity of Ti[N(CH3)2]4 with the functionality and density of molecules in a self-assembled monolayer. Extent of reaction, stoichiometry at the interface, ligand loss and decomposition have also been investigated in this study.
A second area of research has involved the formation of organic-on-inorganic structures. Supersonic molecular beams have been employed as sources for deposition of thin films of pentacene, an organic semiconductor, on bare SiO2 and SiO2 modified with hexamethyldisilazane (HMDS). Organic materials are often bound by rather weak dispersion (van der Waals) forces and crystallize in different phases, separated in total energy by a few kBT. Consequently, considerable promise exists in the use of these energy tunable molecular beams for the deposition of organic thin films. Experiments have provided significant insight into fundamental phenomena involved in nucleation in the monolayer regime, and both the kinetics of thin film deposition and the microstructure in the multilayer regime, evidenced by results from ellipsometry and atomic force microscopy (AFM). Promising performance characteristics have been obtained for organic thin film transistors (OTFTs) fabricated from these pentacene films which can be correlated to film microstructure. Finally, modification of the dielectric surface with hexamethyldisilazane (HMDS) has been found to strongly influence nucleation and greatly enhance OTFT performance, possibly due to reduced charge trapping at the semiconductor-dielectric interface.This work was supported by the Cornell Center for Materials Research (CCMR), a Materials Research Science and Engineering Center of the National Science Foundation (DMR-0079992). Additional support was also provided by a Nanoscale Interdisciplinary Research Team on Inorganic-Organic Interfaces (NSF-ECS-0210693) and the Semiconductor Research Corporation via the Center for Advanced Interconnect Systems Technologies (SRC task 995.011).

title: Ultra Narrow Silicon FETs Integrated With Microfluidic System for Serial Sequencing of Biomolecules

Based on Local Charge Sensing
abstract: Ultra-narrow channel silicon field effect transistors (FET) with suspended gates, integrated with on-chip micro-fluidic delivery system are demonstrated. These devices are designed to be used for serial sequencing of DNA, RNA and proteins, by detecting the local charge variations along these molecules as they are passed between the gate and the channel of the FETs in an aqueous solution. Devices are fabricated with down to 5 nm high tunnels passing between the gate and the channel of the FETs, integrated with larger scale micro-fluidic delivery system. The smallest fabricated active area width is less than 10 nm. A silicon nitride based shallow trench isolation (STI) scheme is developed in order to accommodate fabrication of the tunnels going through the FET, through removal of sacrificial silicon dioxide in HF. A device architecture with an independently controlled side-gate, surrounding the active area, is developed to suppress the edge related leakage currents and allow further scaling of the device width while achieving high sensitivity. The side-gated devices are fabricated as nFET prototypes using thermally grown silicon dioxide gate insulator and silicon nitride STI. The leakage currents are suppressed below 50 fA down to 70 nm gate length with the application of a negative side-gate bias. Side-gated sub-10 nm wide devices exhibit threshold voltage tunability in a range exceeding 2.5 V and with a maximum sensitivity of ?Vt/?Vside > 2 V/V. Wider channel devices with gate lengths less than 70 nm retain Ion/Ioff ratios exceeding 109 and achieve drive currents exceeding 1.5 mA/?m. Narrow channel devices with 150 nm gate length show less than 5 mV/V drain induced barrier lowering. With these performance parameters, side-gated device geometry is a promising candidate for future generation low-power, and higher performance circuits. The possibility of using this device geometry as a side-trapping FLASH memory structure is also demonstrated. A capacitance measurement technique is developed to achieve aF resolution using an instrument with 0.1 fF resolution at 1 MHz utilizing the random fluctuations. These capacitance measurements, performed on the small scale devices, are used to extract effective device dimensions, carrier density and effective carrier mobilities.

title: Dietary and Medical Control of Urate Crystalluria in the Feline Patient
abstract: Senior seminar (D.V.M.)--Cornell University, 1995.
Includes bibliographical references (leaf [10]).Tammy is a 10 year old, female spayed black domestic short haired cat with a 6 year history of recurrent cystitis with hematuria and crystalluria. Urinalysis reveals ammonium urate crystal formation. Surgery was performed to remove two, one centimeter, 100% ammonium acid urate stones which were radiographically evident in her bladder. Repeated laboratory tests are inconsistent with liver disease, portosystemic shunts, renal disorders, or any common cause of urate crystalluria. General considerations involving disorders of micturition are presented, with an emphasis on urate cystitis. Additionally, medical and dietary control of this problem in the feline patient is discussed.

title: Exocrine pancreatic insufficiency in a German shepherd dog
abstract: Senior seminar (D.V.M.)--Cornell University, 1999.
Includes bibliographical references (leaves [9-10]).A two year-old spayed, female German Shepherd Dog was referred to the Cornell University Companion Animal Hospital on October 22, 1998 for further evaluation of diarrhea that was poorly responsive to treatment. The owners first noticed signs of diarrhea and weight loss when the dog was less than a year old, after being boarded at a kennel. The referring veterinarian diagnosed

her with exocrine pancreatic insufficiency (EPI) and possible bacterial overgrowth after a physical exam and lab work in March, 1997. Physical exam revealed no abnormalities except a thin dog with diarrhea. The lab work revealed a low trypsin-like immunoreactivity (TLI) of 0.5 ngfml (Reference range: 535 ng/ml) consistent with EPI. The referring veterinarian began treating her for EPI with the following drugs: Tagamet, Viokase powder, and linmodium and Pepto Bismol as needed. She was also cycled on and off Metronidazole and Tetracycline depending on the severity of her clinical signs. She was started on Hills L?D canned with Eukanuba Low Residue dry dog food. Although she has responded to the therapy, the dog was referred to Cornell because of recurrent diarrhea flare-ups and incomplete weight gain.

title: An outbreak of furunculosis at a fish farm : the diagnosis, control, and prevention of systemic Aeromonas salmonicida infection
abstract: Senior seminar (D.V.M.)--Cornell University, 1999.
Includes bibliographical references (leaf [7]).The following is a case of fish disease that occurred mid-September 1998 in Canada. The site manager of an Atlantic salmon (Salmo salar) fish farm called a fish veterinarian to report his concerns. These concerns included gradually increasing mortalities in three of his eight seawater fish pens over the past two weeks. Normally, he expected to have an average of 10 mortalities per day per pen, but the number had increased to an average of 40. He said that the affected fish were lethargic, anorexic, and had a dark body color. The site manager was also worried, because a fish farm one mile away was reportedly having disease problems. Because this histoiy was vague and not indicative of any specific disease, a visit to the farm was scheduled.
The fish farm was located on a southern bay of Newfoundland. This is a center for salmonid aquaculture, because it has proper water temperatures and good tidal movement to flush away organic matter produced by the fish. The farm itself had eight polar circle pens with nets extending to 20 feet in depth. Each pen included 10-15 thousand fish, which had been hatched in a single freshwater hatchery in the spring on 1997. They were transferred to this saltwater site in the spring of 1998 for growout to a weight of 5-8 pounds. This population had not suffered any serious outbreaks of disease in that time and had not been exposed to antibiotic treatment.

title: Choosing to buy a practice

abstract: Senior seminar (D.V.M.)--Cornell University, 2001.
Includes bibliographical references (leaf 10).When senior veterinary students say that they want to own a practice one day, do they really know what they are talking about? Most students have no idea what owning a veterinary practice is like. Two credits of a practice management class do not quite make these students MBA material. Are these budding entrepreneurs truly prepared to operate a small business? The decision to buy a practice should not be taken lightly. Owning a practice is a life-changing commitment ?not something to ?try out? for a couple of years. Often ignored are the downsides of practice ownership, including: increased responsibility, increased stress, interrupted vacations, and time taken away from a veterinarian?s true specialty ?medicine. It should be obvious that ownership is not for everybody. Some veterinarians will simply be much happier as associates. Yet, the pot of gold at the end of the rainbow is sometimes difficult to resist. Future and recent grads who are set on owning a practice need to evaluate themselves and their lives in order to determine when and if practice ownership is right for them. Can you buy a practice? Should you buy a practice? These are two very different questions, and they both deserve careful thought. What this self-evaluation amounts to is a seemingly endless series of questions. There are no right or wrong answers, per se, just answers that may suggest one career option over another. Do you have what it takes? Ask yourself the following questions, and judge your responses. It should be obvious how responses differ between entrepreneurs and couch potatoes.

title: Necrolytic migratory erythema in a shih tzu
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaf 8).Digbee, a seven year old male, castrated Shih tzu presented to the Cornell Dermatology Service with a progressive history of crusted, pruritic, ulcerative lesions on mucocutaneous junctions. Clinical diagnostics consisted of a CBC/Chemistry Panel, bile acid assay. urinalysis, ultrasound and skin biopsies. The histopathology of the skin biopsies were pathogneumonic for Necrolytic Migratory Erythema. Introduction/Case History: Digbee is a seven year old, male castrated, 14.5 lb. Shih tzu that presented to the Cornell University Dermatology Service on 6/16/2002 for pruritic, crusting, ulcerative dermatosis of the footpads, ventral abdomen and external genitalia. Three months before presentation at Cornell, Digbee?s paws became severely erythematous and pruritic. One month previous to presentation Digbee?s paws progressed to erosion, ulceration and crusting making it difficult for him to walk. The lesions then spread to his prepuce and anus. The crusting around his prepuce and anus caused obstructive stranguria and tenesmus. The referring veterinarian prescribed an antihistamine with no noticeable improvement.

Digbee was then prescribed a course of methylprednisolone and Baytril with some improvement noted in terms of comfort level. However, after the course of steroids was completed, Digbee relapsed to not walking and was placed back on steroids and antibiotics but with no noticeable improvement. The rDVM performed a complete blood cell count and chemistry panel, which revealed a mild hyperglycemia and increases in alkaline phosphatase and alanine transferase. Two days previous to presentation at Cornell, the owner noticed small, multifocal lesions on the ventrum and occassional whole body tremors at which time he was referred to Cornell with a tentative diagnosis of pemphigus foliaceous.

title: Anesthetic Management of a Kemp's Ridley Sea Turtle
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaves 14-15).A male juvenile Kemp?s Ridley sea turtle presented to the Marine Animal Rehabilitation Hospital at the New England Aquarium in Boston in November of 2001 for treatment of disease associated with "cold-stunning". On presentation at the rehabilitation hospital, the turtle received initial therapies to correct hypothermia, dehydration, electrolyte abnormalities and malnutrition. Once stabilized, he was gradually introduced into a controlled aquatic environment but was unable to control his buoyancy. The turtle could swim and float at the surface but could not dive. Radiographs and ultrasound were non-diagnostic, and the veterinary staff elected to perform a laparoscopic exploratory under general anesthesia. Anesthesia of sea turtles presents several unique challenges. Unique aspects of the cardiovascular system include the potential for perianesthetic intra-cardiac shunts and the adaptation to breath-hold for extended periods of time. The dive reflex triggers significant bradycardia, peripheral vasoconstriction and prolonged apnea which can have marked effects on induction as well as recovery from anesthesia. The anesthetic protocol used in this case will be presented including a description of monitoring techniques and supportive peri-operative care. Recovery is often markedly prolonged in sea turtles as was true in this case, and the paper will conclude with a brief discussion of select alternative protocols with potential to expedite recovery from anesthesia.Advisors: Dr. Noha Abou-Madi Dr. Lysa Posner

abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaf 15)."Sadie-Mae", a 10 year-old spayed female mixed breed dog, presented to the Small Animal Medicine Service for inappetance, lethargy, weight loss, incontinence, occasional constipation and questionable polyuria. Physical exam was unremarkable except for some mild hepatomegaly and slightly enlarged popliteal lymph nodes bilaterally. A complete blood count was within normal limits. A serum chemistry profile indicated a mild hypomagnesemia and a marked hypercalcemia. A parathyroid panel revealed a mildly elevated intact PTH level, a marked elevation in ionized calcium and a PTHrP level that was within normal limits. Cervical ultrasound revealed a small, focal, round-oval hypoechoic nodule in the thyroid tissue on the right side. These results suggested a diagnosis of primary hyperparathyroidism. Sadie-Mae's owners opted to pursue therapy using ultrasound-guided percutaneous ethanol injection to the chemically ablate the affected parathyroid gland.Advisor: Richard Goldstein DVM, DACVIM

title: A Store Yet Untouched: Speculative Ideologies in Eighteenth-Century English Literature
abstract: This dissertation explores the ways in which attacks on speculative practices articulated in the financial literature of the seventeenth and eighteenth centuries were revised and reformulated in the literary productions of eighteenth-century English fiction writers. The title of this dissertation derives from William Hazlitt?s remark that the ?past is?like money that is spent,? while the future ?is like a store yet untouched, and in the enjoyment of which we promise ourselves infinite gratification? (?On the Past and Future?). Hazlitt?s figuration of time as money refers us to an important historical connection between England?s revolutionized financial order and alterations in the individual?s relationship to futurity. The financial revolution, as P.G.M. Dickson famously styled it, brought the British a new sense of the individual?s control over his or her material destiny in the temporal order of things; and the challenge it posed to a Providentialist view of history was addressed and negotiated by countless literary texts of the period in explicit or implicit fashion. Rather than sidestepping the vexing theoretical problem of how a revolution could be said to exist independently of the discourse that names it so, this dissertation argues that the historically significant fictional discourses of the eighteenth century acted to mark the historical moment as one particularly interested in the status of the forward-looking (often explicitly financial) subject. Ascertaining how texts of this period established ethical distinctions between prudential foresight and ?scheming? offers a new way of understanding the development of eighteenth-century fiction as well as the broader cultural narratives from which those fictions drew energy and, indeed, a readership. The carving of ethical space for the speculative subject, one who was forward-looking without being either presumptuous or manipulative, is shown to be a central moral concern and literary opportunity for writers such as Daniel Defoe, Richard Steele, Alexander Pope, Eliza Haywood, Samuel Richardson, Henry Fielding, and Samuel Johnson.

title: An Analysis of the Events that Sustained the Crisis in Indonesia
abstract: This research aims to uncover the forces that led to the intense nature of the 1997 financial crisis in Indonesia. While the crisis struck many countries in Asia, Indonesia was particularly hard hit. By examining the how the Jakarta Stock Exchange and the Indonesian Rupiah reacted to news events during the crisis, this research seeks to identify which kind of news events where most responsible for Indonesia?s volatility during the crisis. Where market players taking cues from the IMF and external credit rating agencies during the crisis or were they responding to events inside of Indonesia?

The core data for this research are daily rupiah-U.S. dollar exchange rates and Jakarta Stock Market index quotes from July 1997 until October 1999. To analyze the variation in the data, news variables based on the Dow Jones News Service and other news outlets are used. Three main methods are used to analyze the interaction between markets and news. First I identify a set of key events using headlines from the New York Times. For each event I analyze the movements of markets during that period. Next rather than start with top news stories, the top 50 market movements for both the rupiah and Jakarta Stock Exchange are identified. The news events behind these movements are analyzed to determine which types of news (political, policy-related, international, civil unrest, etc.) drove the markets during this tumultuous period. Lastly indicator variables representing the various types of news are regressed separately on the daily quotes for the rupiah and the stock exchange. This gives a more exact measure of the impact of each type of news category. Testing for changes in the regression coefficients over time allows me to identify the most intense part of the crisis.

A consistent picture of the crisis emerges from these three methodologies. First we see that the rupiah is more volatile than the Jakarta Stock Exchange index. The currency responds vigorously to both good and bad

news while the stock market is less affected by bad news and consistently buoyed by good news. While the stock market may have lost considerable value because of the declining exchange rate, that aside, the market seemed to do relatively well considering the severity of the crisis. The importance of domestic news events also stands out. Although the announcements of international agencies like the IMF and World Bank were an important part of the crisis, the three key sources of domestic news have larger impacts: politics, policy, and civil unrest. This research shows that many of the events that sustained the crisis where not external to Indonesia. This research is able to give quantitative credence to the popular idea that Indonesia?s crisis transformed over time from a financial/economic crisis to a political/social crisis.

title: Three Essays on Poverty Analysis
abstract: This dissertation is a collection of three essays that cover issues in poverty analysis. The first essay (Partial Identification of Poverty Measures with Contaminated and Corrupted Data) applies a partial identification approach to poverty measurement when data errors are non-classical in the sense that it is not assumed that the error is statistically independent of the outcome of interest, and the error distribution has a mass point at zero. This paper shows that it is possible to find non-parametric bounds for the class of additively separable poverty measures. A methodology to draw statistical inference on partially identified parameters is extended and applied to the setting of poverty measurement. The methodology developed in this essay is applied to the estimation of poverty treatment effects of an anti-poverty program in the presence of contaminated data.

The second essay (On the Design of an Optimal Transfer Schedule with Time Inconsistent Preferences) addresses a very recent literature that studies public policy and its connection to behavioral economics. It incorporates the phenomenon of time inconsistency into the problem of designing an optimal transfer schedule. It is shown that if program beneficiaries are time inconsistent and receive all of the resources in just one payment, then the equilibrium allocation is always inefficient. In the spirit of the second welfare theorem, I also show that any efficient allocation can be obtained in equilibrium when the policymaker has full information. This assumption is relaxed by introducing uncertainty and asymmetric information into the model. The optimal solution reflects the dilemma that a policymaker has to face when playing the roles of commitment enforcer and insurance provider simultaneously.

The third essay (Does Conditionality Generate Heterogeneity and Regressivity in Program Impacts? The Progresa Experience) studies both empirically and theoretically the consequences of introducing a conditional cash transfer scheme for the distribution of program impacts. Intuitively, if the conditioned-on good is normal, then better-off households tend to receive a larger positive impact. I formalize this insight by means of a simple model of child labor, applying the Nash-Bargaining approach as the solution concept. A series of tests for heterogeneity in program impacts are developed and applied to Progresa, an anti-poverty program in Mexico. It can be concluded that this program exhibits a lot of heterogeneity in treatment effects. Consistent with the model, and under the assumption of rank preservation, program impacts are distributionally regressive, although positive, within the treated population.The Consejo de Ciencia y Tecnologia del Estado de Aguascalientes (CONCYTEA), the Consejo Nacional de Ciencia y Tecnologia (CONACYT), and the Ford-MacArthur-Hewlett Foundation Graduate Fellowship in the Social Sciences.

title: GENDER, HISTORY AND MODERNITY: REPRESENTING WOMEN IN TWENTIETH CENTURY COLONIAL BURMA
abstract: Tamara Loos, Eric Tagaliacozzo, Anne BlackburnThis dissertation is the first social history of twentieth century colonial Burma to analyze the central role gender played in discourses of colonialism, modernity, and nationalism. It revises the dominant historiography on colonial Burma that reifies and overly emphasizes the significance of ethnicity and is principally concerned with the identification of the origins of the Burmese nationalist movement. This dissertation redresses in particular the occlusion of women and draws attention to the multiple connections between gender and both sides of the colonial struggle, colonial and anti-colonial. Through an interwoven analysis of English and Burmese sources ranging from census reports and confidential memos to missionary pamphlets, fashion advertising, and serialized fiction, my research investigates the emergence of colonial discourses concerning Burmese women and the explosion of censorious and misogynistic representations of "the modern girl" during a formative period that defined Burma's transition from a pre-modern polity to a modern nation-state. What interests motivated these discourses and representations? Why were there no parallel discourses concerning men or masculinity? I argue that modern colonial rule produced a set of conditions in which colonizing and colonized women and men in unequal relations of power co-authored essentially gendered discourses and binary representations of "East" and "West," "tradition" and "modernity," "Buddhist" and "secular," and "colony" and "nation." The socio-historical conditions I attend to include: the large influx of single male immigrants from England and British India; the establishment of secular government-funded educational institution; the formation of a new textual culture which was founded on popular print and visual media; and the centrality of "the status of women" to the colonial civilizing mission and the modernization projects of the indigenous elite. My study examines the complex and sometimes contradictory effects these conditions had on the status of women in colonial Burma and on the emergence of a popular discourse on "Burmese women" that became a privileged idiom for articulating, interpreting, and discussing new and old social inequities.Institute of Historical Research (University of London), American Association of University Women, Mario Einaudi Center for International Studies (Cornell University), Feminism, Gender, and Sexuality Studies Program (Cornell University), Department of History (Cornell University), Southeast Asia Program (Cornell University)

title: A Critique of the Status Exchange Theory of Merton and Davis in Mate Assorting
abstract: In this paper I reexamine the status exchange hypothesis (Davis 1941; Merton 1941), which argued that minorities exchange their high socioeconomic status for the "high" social status of whites. Specifically, I reanalyze the cross-classification table presented in Fu (2001) on recent marriages among whites, blacks, Mexicans, and Japanese (from the 1990 PUMS data), which claims to corroborate the status exchange hypothesis for intermarriage between whites and blacks as well as between whites and Mexican Americans. Using a simple quasi-symmetry model, I show that the same-race and mixed-race marriage share a broadly similar pattern of educational homogamy, which is quasi-symmetric in character. Thus, I argue that this suggests little, if any, evidence for the status exchange hypothesis. Furthermore, the evidence strongly indicates that there is a remarkable consistency and symmetry in husband/wife educational attainment regardless of race (with the possible exception of white/white marriages); intermarried couples share a similar level of education, and educational homogamy dominates the educational marriages, no matter how strong the racial endogamy is.

title: The Emerging Economy-Industrial Complex
abstract: This Masters Thesis is a synthesis of two papers that address how changes in global industrial structures affect regional-specific industrial organization. The first paper is a characterization of the response of Indonesian manufacturing firms to the Asian financial crisis in 1997. The second paper is a characterization of the how to induce a response from firms (specifically multinational seed companies) with research capacities in the agricultural biotechnology sector in developing countries. The lessons from both papers are broadly centered on effective growth policies and it?s relation of private sector and foreign direct investments. Specifically, an economic development agenda concentrated only on the private sector will not necessarily guarantee that firms will take advantage of ideal economic scenarios. As the case of Indonesian firms demonstrated, uncertainty and perceptions of the local economy affect the extent to which the private sector should have led growth through exports during devaluation of the Indonesian currency. In contrast, the capacity for research and development in agricultural biotechnology is grossly underdeveloped in Africa, and limited to only a few countries. The massive intellectual capacity of a largely consolidated seed industry actually becomes beneficial for firms to take greater risks and spur sector development. Reading the following papers as a policy maker, one would thus gain valuable insight to the complexities of industrial development. As a researcher and student, one should be interested in these studies as a call attention to areas with potential for future research. The implications of research into firm-level response of Indonesian export firms will greatly affect future empirical work on trade theory and economic growth policies because it highlights a circumstance that runs somewhat contrary to trade theory predictions. Policies need to take into account the extent to firm response to financial crisis and ability to face adverse economic situations. The immediacy of riskanalysis research in the biotechnology sector in Africa is equally important and unexhaustive. If foreign investments are to play an important role in the development strategy for African countries, it must take into account the decision making processes of firms willing to take on high-cost projects with low immediate returns.

title: Defending Organizational Legitimacy after Enron: The Symbolic Use of Stock Option Accounting
abstract: David Strang, Richard Swedberg, Michael LounsburyThis paper examines the forces driving the adoption of an accounting practice, stock option expensing (SOE), among the Fortune 500 in the wake of the recent corporate scandals. I argue that in the ensuing debates and challenges to the legitimacy of existing institutional frameworks governing corporate behavior, SOE became a symbol of normative legitimacy and a way for organizations to defend against threats to their own legitimacy. In analyzing the effects of different types of legitimacy threats, the results indicate that organizations in industries that were under intensive levels of investigation were more likely to adopt SOE, but that negative media scrutiny and shareholder activism did not influence SOE adoption. The results also suggest that as the Financial Accounting Standards Board threatened to require SOE, the significance of the practice as a symbol of normative legitimacy began to diminish. The findings broaden and deepen our understanding of how organizations engage in symbolic practice adoption to defend their legitimacy as well as the processes shaping the social construction of accounting practices. This paper also provides empirical support for recent theoretical claims regarding legitimacy defense and expands upon recent work that has made links between the impression management literature and neoinstitutional theory.

title: Manuscripts and Water Quality Data for Watersheds and Lakes in Central NY, 1972-2003
abstract: David Bouldin, Emeritus Professor, Crop and Soil Science, Cornell University ---
E-mail: DRB6@Cornell.edu ---
In 1970 Cornell University received a grant from the Rockefeller Foundation to study runoff from land and its impact on water quality. A multidisciplinary team, focused on the lakes and landscapes in central NY, was developed and led by Professor Robert J Young. Since the above project was finished, I have continued

to monitor Fall Creek, sub-watersheds in Fall Creek, other tributaries to Cayuga Lake and the aquifers on the Harford T and R center. (intro.doc) --- The appended files describe the results of analysis of over 3000 water samples, 1970- 2003, concerned with land runoff and the lakes in central NY. Major findings follow. References to the appropriate document can be found in the folder "mss" --- Three P fractions were measured: MRP, TDP and TP. MRP is measured on filtered samples without treatment and is presumed to be mostly inorganic P in solution. TDP is measured on filtered samples after oxidation of organic forms of P and hence is total Pin solution. TP is particulate P plus TDP. Usually MRP and TDP are considered the major forms used by algae. (ms1, ms2, ms13, ms14) --- The average TDP in about 1500 samples from Fall Creek was 0.026 mg per liter, loading was about 4400 Kg P or about 0.13 kg/ha/year . About ? was MRP. Total P was about 0.140 mg/liter. Approximate sources of TDP are as follows: 50% from inactive agriculture and forest, the other 50% attributed to human activities of which about half from diffuse sources and half from point sources. MRP concentrations in runoff from 16 subwatersheds, February to April of 1973, varied from 0.006 to 050 mg/l. The TDP in Cayuga Lake ranges from 0.005 to 0.020 mg per liter (ms3, ms4, ms5, ms6, ms7). --- NO3 loading from Fall Creek is about 5 kg/ha /year; this is about 80% of the input of inorganic N in precipitation. This is a consequence of mosaic of sources varying widely in concentration. NO3 loading from 9 subwatersheds in Fall Creek varied from 1 to 7.7 kg/ha/year; no samples containing more than 10 ppm was found. (ms8,ms5,ms9,ms6,ms7,ms10) --- Streams draining wooded areas without human habitations or active agriculture have NO3 concentrations and loadings on the order of 20 % of the inputs of inorganic N from precipitation (~1kg/ha/year). and similar to those found in the Catskill and Hubbard Brook in NY (ms5,ms6,ms7,ms9) --- There are unlikely to be more than a very few small streams in the Cayuga Lake watershed in which the concentration of NO3-N will exceed the 10 ppm public health standard. However aquifers under heavily fertilized fields may contain more than the public health standard. (ms9, ms5) --- Estimates of evapotranspiration (ET) for Fall Creek did not change statistically during the period 1926-1996 as estimated by annual precipitation input minus stream outflow, indicating that land use changes were not important in influencing ET.(ms_15) --- The most important sampling protocols are the following: Concentrations of constituents in stream water vary seasonally and with flow intensity. This means that a) timing of sampling must be carried out during all seasons and over all flow regimes, b) amounts of various substances such as N, P and sediment transported to lakes and reservoirs are the product of flow multiplied by concentration which means that flow measurements must be made at the same time as samples are taken for analytical determination and c) most of the water leaves the watershed during the 10 to 20 % of the time that highest flows occur; this means that timing of sampling must include frequent sampling during storm events. With respect to TDP, point sources will be most evident under low flow conditions while non- point sources will be most evident under high flow conditions. Loading of non point sources is thus very much dependent on the 10 % to 20% of the time when highest flow conditions occur. --- The most important conclusion I reached about watershed management is the following. Watershed management requires detailed knowledge about the cost of several management options per unit of decrease in loading/ concentration. Our experience was that the various human activities in sub watersheds were correlated with each other. This meant that statistical analysis of correlations between loading of N and P were useless in identifying the management options which would be most beneficial. This also means that commonly used procedures for validating models are useless in terms of developing management strategies . (Ms12)

title: Protein Folding with Coarse-Grained Off-Lattice Models of the Polypeptide Chain
abstract: A hierarchical approach, together with the United
Residue (UNRES) model of the polypeptide chain, is used to study protein structure prediction.

First, an efficient method has been developed as an extension of the hierarchical approach for packing alpha-helices in proteins. The results for 42 proteins show that the approach reproduces native-like folds of alpha-helical proteins as low-energy local minima. Moreover, this technique successfully predicted the structure of the largest protein obtained so far with the UNRES force field in the sixth Critical Assessment of Techniques for Protein Structure Prediction (CASP6).
Next, two popular methods of global optimization are coupled, and the performance of the resulting method is compared with that of its components and with other global optimization techniques. The Replica-Exchange Method together with Monte Carlo-Minimization (REMCM) was applied to search the conformational space of coarse-grained protein systems described by the UNRES force field. In summary, REMCM located global minima for four proteins faster and more consistently than two of three other global optimization methods, while being comparable to the third method used for comparison.
Finally, efficient methods for calculating thermodynamic averages were implemented with the UNRES force field, namely a Replica Exchange method (REM), a Replica Exchange Multicanonical method (REMUCA), and Replica Exchange Multicanonical with Replica Exchange (REMUCAREM), in both Monte Carlo (MC) and Molecular Dynamics (MD) versions. The algorithms were applied to one peptide and two small proteins (with alpha-helical and alpha+beta topologies). To compare the different methods, thermodynamic averages are calculated, and it is found that REM MD has the best performance. Consequently, free energy maps are computed with REM MD, to evaluate the folding behavior for all test systems.This work was supported by National Science Foundation (NSF) and National Institutes of Health (NIH). Support was also received from the National Foundation for Cancer Research. This research was carried out by using the resources of our 392-processor Beowulf cluster at the Baker Laboratory of Chemistry and Chemical Biology, Cornell University, the National Science Foundation Terascale Computing System at the Pittsburgh Supercomputer Center, and the National Center for Supercomputing Applications System at the University of Illinois at Urbana-Champaign.

title: FARMING BY THE BOOK: Food, Farming, and the Environment in the Bible and in the Qur-an
abstract: Food, farming, and environmental care are key topics in the study of agricultural sustainability. Agricultural sustainability is holistic in its approach, so religion and ethics need to be considered as aspects of the topic. Religious considerations become especially important when academic and development specialists must communicate with and motivate religious audiences. Thus, development agencies such as the World Bank are now collecting and distributing information about the religious beliefs of potential clients as they relate to food, farming, and the environment. The material provided here offers an in-depth treatment from the perspective of three religions: Judaism, Christianity, and Islam. A comprehensive compilation of passages about food and agriculture is supplemented with brief annotations. Because there are many publications about religion and the environment, only the core scriptures about environmental care are covered here. The passages are taken from the primary religious sources (the Bible and the Qur-an) used by Jewish, Christian, and Muslim communities. The goal is to help current and future agricultural development workers understand and communicate in terms that audiences with those religious backgrounds will appreciate.

title: A SOCIAL RESOURCE MODEL OF POLITICAL PARTICIPATION:MASS MEDIA USE, SOCIAL

CAPITAL, AND POLITICAL PARTICIPATION
abstract: This dissertation explores the theoretical foundation and empirical significance of the social resource model of political participation, an approach that views political participation as an outcome of individuals? use of social resources created by social connectedness. Building on the decomposition of the concept of "social capital," I explicate the mechanisms through which non-political resources?formal membership, social trust, talk and tolerance?function to facilitate political behaviors. In addition, I examine how such social resources enhance or substitute for other resources that are already established as individual-level determinants of political participation, such as formal education or mass media use. I employ three datasets that include measures of social and individual resources with respect to political participation: The Social Capital Benchmark Survey (2000), the National Election Study (2002), and the American Citizen Participation Study (1990). Results show that political (dis)engagement can be meaningfully explained by understanding why some people are better or more poorly able to utilize certain forms of social resources, regardless of or beyond their individual capabilities or options. It is important to note, however, that different forms or dimensions of social relations contribute differently not only to the generation of social resources but also to political mobilization. In addition, this dissertation shows that social resources reinforce the effects of individual capital on political participation. Most of all, the structural and communicative forms of social resources add to the political reservoir of those who are highly educated. The significant interaction effects of television use and social resources support television?s ?time displacement? and ?worldview? explanation of participation inequality. In future research, the nexus where social resources meet individual resources should be the focal point for the study and development of the social resource model of political participation.

title: LEGISLATING ACCESS AND REDRESSING INEQUALITY? THE COMMUNITY REINVESTMENT ACT AND MORTGAGE LENDING IN POST-APARTHEID SOUTH AFRICA
abstract: William Goldsmith, Rolf Pendall, Sandra GreeneSouth Africa's brutal apartheid system came to an official end in 1994, when the African National Congress (ANC) won the majority of seats in the country's first democratic elections. Since that time, the ANC-led government has struggled with the challenge of redressing the inequitable access to resources and opportunity resulting from South Africa's history. Community reinvestment legislation is one tool in this effort, and the dissertation considers the following question: is a Community Reinvestment Act (CRA) an effective means through which to redress unequal access to housing finance, and thereby unequal access to housing, in post-apartheid South Africa.

The study sheds light on three broader questions. First, can legislative efforts be as effective when used to promote access to resources and opportunity as they are when used to bar access to resources and opportunity? Second, what are the real possibilities of effecting a redistribution of resources in a society on the capitalist periphery? Third, can the tools of capitalism be used to correct the inequitable distribution of resources created by apartheid's racist form of capitalism?

The study concludes that the answer to the question regarding the effectiveness of a CRA is "no." Through analysis of 30 interviews with bankers, government officials, housing and lending specialists, and community activists and through regression analysis of the geographic distribution of bank loans throughout South Africa's Gauteng Province, it is determined that the provisions in South Africa's draft Community Reinvestment Bill would neither have broadened access to the country's banks nor increased the flow of funds into previously marginalized communities.

The study moves from examination of the draft legislation's structural failures to consider its procedural failures, providing a detailed examination of the political and economic factors that led to CRA's withdrawal from the legislative agenda. Following this, the study explains why, given the inappropriate structure of the

proposed CRA and the limited likelihood that it would be accepted by the necessary range of actors in South Africa, the Department of Housing nevertheless attempted its passage.Graduate School of Cornell University, Department of City and Regional Planning of Cornell University, Mario Einaudi Center of Cornell University, Institute for African Development of Cornell University, Program on International Studies in Planning of Cornell University, Alumnae Association of Mount Holyoke College, Department of International Relations and Law and Politics of Mount Holyoke College

title: LEGACY AND POLICY EFFECTS ON SPATIAL DEVELOPMENT IN HUNGARY AND BULGARIA
abstract: David L. Brown, Valerie J. Bunce, Douglas T. GurakThis dissertation investigates the relationship between socioeconomic and spatial development in Eastern Europe from a historical perspective. I examine how global and national processes affect localities, and what their impact is on the spatial distribution of population and economic activities over time. The backdrop for this study is the historical transformation of Eastern Europe from a predominantly agricultural region to a modern industrial one, even if this modernity can be labeled as "delayed", "distorted" or "dependent" when compared to the Western experience. When investigating socioeconomic and spatial development over time, I focus on the impacts of two fundamental processes, historical legacies and development policies. Legacies and policies must be connected in order to understand their impact on patterns of socioeconomic and spatial development over time, and to assess trends for the future.

I approach the study of social and spatial development from an interdisciplinary standpoint, working at the intersection of development sociology, social demography, political science and population geography. The conceptual project of this study is to connect these disciplines' accumulated knowledge on Eastern Europe, and articulate causal links between processes described by these fields. Although each field has accumulated considerable knowledge on development in the region separately, there hasn't been a systematic effort to connect these findings in a historical perspective. I use a comparative framework to achieve this goal, and hence I discuss the Eastern European development trajectory vis-?-vis the Western experiences. The particular contribution of this study is to connect the political theory of Eastern European "backwardness" to an analysis of the region's socio-demographic change, population redistribution and urbanization in particular. The dissertation's empirical project is to examine population distribution and urbanization dynamics in Eastern Europe. I investigate how spatial development occurred in the context of broader socioeconomic development, and how various policies and legacies affected settlement morphology and population redistribution. This analysis will use the cases of Hungary and Bulgaria. Hungary will be the central analytical case of this study, and I will use Bulgaria to demonstrate the intraregional heterogeneity of Eastern Europe.Polson Institute for Global Development, Echo Survey Institute

title: REALTIME PCR SYSTEMS TO MONITOR YEASTS IN GRAPE MUST AND WINE
abstract: The quality of beverages, particularly wine, depends largely on their microflora. Yeast and bacterial fermentations shape the product flavor profile, and can cause spoilage. Current detection methods for microorganisms are usually either inaccurate, slow, or both. In this project, realtime PCR systems were designed to test wines for the presence of certain microorganisms. The sampling method during wine

production was optimized to ascertain that the microflora in the samples is representative of the whole tank. Four different sampling locations within the vertical axis of stainless steel tanks were tested during both the alcoholic and the malolactic fermentation. Saccharomyces cerevisiae and Oenococcus oeni were enumerated by plating. The results showed that a representative number of viable cells is obtained by taking a sample from the sampling valve. Part of the actin gene (Act1) was sequenced as the basis for the realtime PCR. Detection systems for the three undesirable wine yeasts Brettanomyces bruxellensis, Hanseniaspora uvarum, and Pichia anomala were designed and validated. The extraction methods were optimized to ensure that they were quantitative within a suitable range. The specificity of the detection systems as well at their threshold and range were very satisfactory. The realtime PCR system for B. bruxellensis was used to determine whether there is a quantitative connection between B. bruxellensis contamination and the marker phenols 4-ethylphenol, 4-ethylguaiacol, and 4-ethylcatechol or the subjective sensory impression. The experiments show that although B. bruxellensis does produce the known marker phenols, there is no mathematical correlation between the volatile phenol concentration and cell counts. The influence of sanitation procedures on the occurrence of B. bruxellensis in wineries was investigated using plating and realtime PCR. B. bruxellensis was found in most locations in wineries, including the wines. The inheritance of the teinturier phenotype was studied in a cross segregating for this character. Segregation results suggest that the primary gene controlling berry skin color also controls berry flesh pigmentation. This new detection method is faster, more accurate, and more sensitive than previous microbial and chemical detection methods. Routine testing of beverages would minimize the effects of spoilage microorganisms, resulting in decreased product losses for the beverage producers.

title: Sacrifice, Ahimsa, and Vegetarianism: Pogrom at the Deep End of Non-Violence
abstract: James T. Siegel; Benedict Anderson; Bernd Lambert; David Lelyveld This dissertation explores the relation of ahimsa (non-violence) and vegetarianism to sacrificial logic in post-independence Ahmedabad. It follows the transformation of ahimsa--from a protection of the sacrifier against the revenge of the animal victim; to a doctrine of renunciation, self-reform, and prohibition of animal sacrifice; to Gandhi?s famous tool for nonviolent resistance to colonial domination; and finally, to the ritualization of violence itself in the organized persecution of minorities in a secular state. Central Gujarat is often called the "laboratory of Hindutva." Hindutva offers an interpretation of "Hinduism" as a historical subject threatened by Islam and Christianity. It portrays Hindus as victims of Muslim barbarism, slaughtered and humiliated, butchered and raped, and demands a response that redefines the relation of violence to ahimsa. Its electoral success can be traced to a claim to unify Adivasi, lower, and intermediary caste groups with the Savarnas (high castes) as "Hindus" in opposition to Muslims and Christians, who are positioned as foreigners. As ethno-religious identifications have become integral to representation in a secular democratic system, traditional practices relating to diet and worship are simultaneously reconfigured. This research investigates the embodiment and experience of disgust among members of upwardly mobile castes, who are encouraged both to externalize their own low caste practices and to distance themselves from Muslims and Christians in new ways. In the 2002 anti-Muslim pogrom in Ahmedabad, an event around which this dissertation turns, I witnessed a mimetic reversal of Hindutva's claim. Violence returns as legitimate punishment of Muslims. The contemporary conjuncture of sacrificial language, beef prohibition, and vegetarianism makes explicit a subliminal criminalization of the dietary practices of minorities positioned permanently outside Hindutva identity. Most criminalized among these groups is the unabashed meat-consuming Muslim. The excessive expenditure of phantasmatic projections onto the Muslim is expressed in a m?lange of culinary and sacrificial idioms. The putatively excessive sexuality, violence, and power of the Muslim are themselves

transformations of the symbolics of food and ingestion. The pogrom and reactions to it reveal how a notion of nonviolence becomes implicated in violence that has a sacrificial character.Social Science Research Council Wenner Gren Foundation

title: IMPACTS OF THE INVASIVE GRASS SALTWATER PASPALUM (PASPALUM VAGINATUM) ON AQUATIC COMMUNITIES OF COASTAL WETLANDS ON THE GALAPAGOS ISLANDS, ECUADOR.
abstract: Invasive plants species pose a threat to ecosystem function, and island ecosystems are particularly vulnerable to their impact. The grass saltwater paspalum (Paspalum vaginatum) has successfully invaded Galapagos Islands, potentially threatening coastal lagoons and their globally significant avifaunal biodiversity. I conducted two studies to assess potential changes in invertebrate populations associated with increased P. vaginatum abundance. The first study evaluated the relationship between abundances of fiddler crab (Uca galapagensis) burrows and habitat conditions (including above ground P. vaginatum densities) measured along transects that spanned lagoon shore-line habitat. Results show that at intermediate P. vaginatum densities, fiddler crab burrow abundance increased proximal to the shoreline and at high water tables and demonstrates the importance of moisture in fiddler crab habitat selection. However, burrow densities were reduced at high and low P. vaginatum densities regardless of habitat. This result suggests that P. vaginatum invasion may benefit the crab at early stages of invasion, but once P. vaginatum reaches high densities fiddler crabs may be excluded from lagoon shoreline habitats. In the second study I assessed whether P. vaginatum is impacting aquatic invertebrates by comparing invertebrate communities across 4 lagoon habitats: P. vaginatum, the interface between P. vaginatum and open water (edge), open water, and emergent mangroves. The invertebrate community in P. vaginatum showed increased species richness and was characterized by more terrestrial species such as polychaetes, tabanid larvae, and syrphid larvae. Invertebrate communities in open water were dominated by highly abundant aquatic species such as corixids (Trichocorixa reticulata) and ostracods. Although invertebrates in P. vaginatum had greater mass/individual than those in water, edge and mangrove, average overall invertebrate biomass was similar in all habitats and across seasons. This suggests that the invasion of P. vaginatum does not affect annual average invertebrate production per se, but rather the relative contribution of each species to the overall biomass. To evaluate whether the shift in invertebrate communities may impact lagoon avifauna, I conducted bird observations, estimated maximum habitat potentially affected by P. vaginatum, and assimilated bird feeding ecology data into an impact assessment table. Results suggest that most waterbirds (flamingos, ducks, herons, migratory shorebirds) generally do not associate with P. vaginatum while food availability for terrestrial birds (yellow warblers, smooth billed ani, mocking birds) may increase. Furthermore, the P. vaginatum invasion degrades foraging habitat and food resources for waterbirds and with further increase may potentially occupy 90.6 % of the lagoon surface area. This potential habitat degradation poses a particular threat to the viability of the Galapagos flamingo (Phoenicopterus ruber glyphorhynchus) population, an endemic subspecies, since a further population reduction may increase extinction risk. My results show that the invasion of P. vaginatum is associated with a shift from an aquatic to a more terrestrial invertebrate community. The continued invasion of P. vaginatum degrades water bird and fiddler crab habitat. Control of P. vaginatum may be necessary to maintain the Galapagos lagoons status as an Internationally Important Wetland.

title: The Effect of the Web on Undergraduate Citation Behavior 1996-1999
abstract: A citation analysis of undergraduate term papers in microeconomics revealed a significant decrease in the frequency of scholarly resources cited between 1996 and 1999. Book citations decreased from 30% to 19%, newspaper citations increased from 7% to 19%, and Web citations increased from 9% to 21%. Web citations checked in 2000 revealed that only 18% of URLs cited in 1996 led to the correct Internet document. For 1999 bibliographies, only 55% of URLs led to the correct document. The authors recommend 1) setting stricter guidelines for acceptable citations in course assignments; 2) creating and maintaining scholarly portals for authoritative Web sites with a commitment to long term access; and 3) continuing to instruct students how to critically evaluate resources.

title: The Effect of the Web on Undergraduate Citation Behavior: A 2000 update
abstract: This paper provides a 2000 update to the 1996-1999 citation analysis of undergraduate term papers by Philip Davis and Suzanne Cohen [JASIST 52(4) 2001, p.309-314]. The total number of bibliographic citations continued to grow in 2000 from a median of 10 in 1996 to 13 in 2000. The growth however is entirely explained by the addition of traditionally non-scholarly materials (Web and newspaper citations). A significant improvement in the accuracy of Internet citations was found when term papers were submitted electronically. In 2000, the first year of electronic submissions, 65% of the citations pointed directly to the cited document, up from 55% in 1999. Internet citations aged six months in both 1999 and 2000 bibliographies were still irretrievable anywhere on the Internet 16% of the time. If we are to see more scholarly citations in term papers, professors must provide clear expectations in their class assignments. Students should be required to submit an electronic copy of their paper so that Internet citations can be scrutinized for accuracy and plagiarism.

title: Where to spend our e-journal money? Defining a university library?s core collection through citation analysis
abstract: This paper identifies core journals in the life sciences for Cornell University researchers by analyzing the frequency of Cornell-authored citations in Biosis Previews between 1996 and 2001. The distribution frequency of journals confirms Bradford's Law of Scatter or the 80/20 Rule. The top 240 journals, providing 80% of the citations, were analyzed by publisher type and institutional subscription price. In general, journals from society and associations received the highest number of citations and were priced considerably lower than commercial journals. The methodology described is a fast, no-cost, and scalable procedure that can be adapted to various subject databases, and may be used to provide guidance on which titles to purchase for electronic access.

title: Ectopic ureter in an adult male dog

abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 9-10).A nine year old male castrated Siberian Husky presented with a history of cyclic fever, anorexia and lethargy of one year in duration, along with chronic urinary tract infections and urinary incontinence. Initial diagnostics revealed a progressive pneumonia, an intramural ectopic left ureter, and left-sided hydroureter and hydronephrosis. The ectopic ureter was corrected via a ureteral transposition, and the animal recovered well from the procedure. Ectopic ureters are a common cause of urinary incontinence since birth or weaning. They may be unilateral or bilateral, and intramural or extramural. The cause of this abnormality is debated, but it is likely dependant on genetic factors. Ectopic ureters are often associated with other structural or functional abnormalities, which should be identified prior to surgery. Surgical correction may be accomplished via a neoureterostomy and urethral / trigone reconstruction, a ureter transposition, or a nephroureterectomy. Advisor: Dr. Richard Goldstein

title: Patterns in Electronic Journal Usage: Challenging the Composition of Geographic Consortia
abstract: Annual electronic journal usage data for the NorthEast Research Library (NERL) consortium was analyzed for 2000 and 2001 for the Academic Press IDEAL aggregate package. Patterns indicated a high degree of skew in the use of the journal collection: a small number of journals formed the majority of total use. Each institution illustrated a unique usage pattern, with some institutions using (proportionally) more or less of the collection. No institution used every title, and some titles were used very infrequently by the consortium as a whole. Title ranking showed high congruence between 2000 and 2001. Titles not subscribed in print, received about ten times less use than locally subscribed titles. Cluster analysis revealed three distinct groups of institutions based on their use of the journal package: 1) Large research institutions, 2) Medical institutions, and 3) Smaller liberal arts colleges and polytechnic institutes. Student enrollment is a good predictor of total usage, with medical institutions being an exception. It is recommended that institutions consider their consortial membership and organize themselves into groups of homogenous institutions with similar missions.

title: Nephrocalcinosis in tilapia from a recirculation production facility
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 9-10).Nile tilapia, Oreochromis niloticus, from a recirculation aquaculture venture in the Northeastern United States were presented to Cornell's Fish Disease Diagnostic Laboratory. The chief complaint was of chronic, low-level tilapia mortalities. Histopathological diagnosis of renal tissue revealed moderate to severe kidney disease due to the precipitation of calcium salts from the short-term use of calcium carbonate to maintain alkalinity in the production system water. Calcium carbonate had been substituted for sodium bicarbonate (the normal industry practice) due to economic considerations. A recommendation was made to return to the use of sodium bicarbonate for water quality maintenance. This change was instituted and levels of nephrocalcinosis in the aquaculture facility's Nile tilapia dropped significantly. Advisor: Dr. Paul Bowser

title: Effect of the Web on Undergraduate Citation Behavior: guiding student scholarship in a networked age
abstract: This article provides the last update to a longitudinal study tracking the research behavior of a multi-college undergraduate course in microeconomics from 1996 to 2001. Student term paper bibliographies grew between 1996 and 2000 but included fewer scholarly resources. In 2001, a return to citing scholarly sources was demonstrated when the professor provided clear and enforceable guidelines in his class assignment. The accuracy and persistency of cited Web documents also increased as a result.

title: An IP-level analysis of usage statistics for electronic journals in chemistry: Making inferences about user-behavior.
abstract: This study reports an analysis of American Chemical Society electronic journal downloads at Cornell University by individual IP addresses. While the majority of users (IPs) limited themselves to a small number of both journals and article downloads, a small minority of heavy users had a large effect on total journal downloads. There was a very strong relationship between the number of article downloads and the number of users, implying that a user-population can be estimated by just knowing the total use of a journal. Aggregate users (i.e. Library Proxy Server and public library computers) can be regarded as a sample of the entire user population. Analysis of article downloads by format (PDF vs HTML) suggests that individuals are using the system like a networked photocopier, for the purposes of creating print-on-demand copies of articles.

title: Information seeking behavior of chemists: a transaction log analysis of referral URLs
abstract: This study reports an analysis of referral URL data by Cornell University IP address from the American Chemical Society servers. The goal of this work is to better understand the tools used and pathways taken when scientists connect to electronic journals. While various methods of referral were identified in this study, most individuals were referred infrequently and followed few and consistent pathways each time they connected. The relationship between the number and types of referrals followed an inverse-square law. Whereas the majority of referrals came from established finding tools (library catalog, library e-journal list, and bibliographic databases), a substantial number of referrals originated from generic web searches. Scientists are also relying on local alternatives or substitutes such as departmental or personal web pages with lists of linked publications. The use of electronic mail as a method to refer scientists directly to online articles may be greatly underestimated. Implications for the development of redundant library services like e-journal lists, and the practice of publishers to allow linking from other resources are discussed.

title: Feline cutaneous asthenia (Ehlers-Danlos syndrome)
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf (11)).Feline cutaneous asthenia is a rare, inherited disorder of collagen production in cats. Similar diseases are found in humans, dogs, mink, horses and mice. In cats, there are two identified modes of inheritance. Both the autosomal dominant and recessive forms cause abnormal packing of Type I collagen. Affected animals have hyperextensible and fragile skin. This disease can be diagnosed via a skin extensibility test, histology and electromicrography. There is no cure, but consistent management can allow affected cats to live long lives. title: Transfer From Print to Electronic Serials
abstract: Comparing the average cost per download for electronic journal packages to the average Interlibrary Loan cost can be both grossly inaccurate and wildly misleading. If forces one to accept the following assumptions: 1) aggregate online use can be compared with print use, 2) all journals cost the same and are used the same, and 3) the set of journals requested by Interlibrary Loan are similar to the set of journals subscribed by a library. This letter to the editor refutes each of these assumptions.

title: Tragedy of the Commons Revisited: Librarians, Publishers, Faculty and the Demise of a Public Resource
abstract: The model of scholarly publishing can be reduced, in economic terms, to a Tragedy of the Commons, whereby the individual interests of publishers, libraries and scholars are in conflict with what is in the best interest of the public good. Serials inflation, price discrimination, and site-license pricing are all manifestations of this dysfunctional economic model. Moral arguments to change human behavior are not effective because they do not provide individual incentives. Technology-alone is also not a viable solution since it fails to change the underlying human behavior that is driving the economic model. Abandoning the current system of publishing is both risky and costly. This paper argues for a reintermediation of the library as governor of the public scholarly commons, but illustrates that these solutions are in conflict with the mission of the library profession.

title: Why usage statistics cannot tell us everything, and why we shouldn't dare to ask
abstract: Publishers currently practice third-degree price discrimination whereby different classes of subscribers are charged different prices based on their ability (or willingness) to pay. Distinguishing the type of user within the institution and determining why a resource was used would allow publishers to start practicing first-degree price discrimination -- an economic environment where publishers can start maximizing profits from each institution. Protecting patron privacy also has unintended consequences of protecting the library budget.

title: For electronic journals, total downloads can predict number of users
abstract: Results from two multiple regression models involving HighWire journal subscriptions for 16 participating universities in the United States, United Kingdom and Sweden for 2003 indicate a highly predictive relationship between the number of article downloads and the number of users, meaning that the size of a user population can be estimated by just knowing the total use of a journal. The relationship is consistent over time and across institutions, and appears to be unrelated to the subject, size or popularity of a journal. It is not consistent across publishers, however, suggesting that an 'interface effect' may exist. The development of a Project COUNTER standard to deal with extreme or abnormal journal usage is necessary if we wish to compare the performance of journals across publishers.

title: Correction of a patent ductus arteriosus in the dog
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine)
Notes: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaves 9-10).This paper describes the correction of a patent ductus arteriosus in a four month-old, intact female cock-a-poo dog. The dog was in congestive heart failure at initial presentation and was sent home on medications to resolve her pulmonary edema prior to PDA correction. One month later, the dog was brought back for coil embolization of her PDA. Under general anesthesia, aortic angiography was performed to assess the size and shape of the ductus. Coil embolization of the ductus was attempted. However, occlusion of the ductus was not achieved due to coil dislodgement. Embolization of both main pulmonary arteries occurred. The dog was recovered from anesthesia and surgical ligation of the ductus was performed two days later. Although trivial flow through the ductus remains, the dog?s heart is reduced in size and no pulmonary edema is noted. Although coil embolization is not without complications, they are not usually life threatening. Coil embolization remains a viable alternative to surgical ligation for treatment of patent ductus arteriosus in most affected dogs.Advisor: Dr. Anna Gelzer Clinician: Dr. N. Sydney Moise

title: The Ethics of Republishing: A Case Study of Emerald/MCB University Press Journals
abstract: It is unethical to republish a journal article without citing the original source. Simple keyword searching of Emerald (formerly known as MCB University Press) online journals from the publisher's web site has identified 409 examples of articles from sixty-seven journals that were republished without such notification from 1989 through 2003. Many of these articles were published simultaneously in journals within the same or similar subject disciplines. Five examples of triple publication were identified. In several cases, neither the editor nor editorial board members reported knowledge of this practice. This article will review the conditions of acceptable republishing plus document and provide examples of republication. It will discuss implications on the publication of record, and question whether this is a case of "let the buyer beware".

title: Temporomandibular Septic Arthritis in a Horse
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 12).Sonny is a 20-year-old male castrated Morgan horse that presented with the chief complaints of quidding, fevers, and a draining abscess over his left eye. He had a previous episode of fever 6 months before, which was successfully treated with oral antibiotics, but subsequently lost a significant amount of weight. The weight loss was partially reversed with addition of grain to the diet. Just prior to presentation at Cornell Sonny's owners noted that he was having difficulty chewing and pretending his food and was depressed. He also suffered from evening fever spikes as high as 103.6 ?F. Sonny was consequently taken to the referring veterinarian who noted left masseter muscle atrophy, a nose pull to the right, and an abscess over the left temporal area. On presentation at Cornell, physical examination revealed a moderately underconditioned horse that was slightly depressed, lethargic, but non-febrile. A 10 cm diameter draining abscess was centered over the left temporomandibular joint. Moderate masseter muscle atrophy was noted on the left side as well as a slight nose pull to the right. The remainder of the physical exam was within normal limits. From the history and physical exam findings, a problem list was formulated and included: draining abscess, fever, difficulty pretending food, nose pull, masseter atrophy, weight loss, and depression. title: Medical management of immune-mediated hepatitis
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 12-14).An 8 year old spayed female Jack Russell Terrier presented for evaluation of previously diagnosed chronic hepatitis. Physical exam revealed jaundice, hepatomegaly, petechiae, and ecchymoses. Bloodwork showed severely increased liver enzymes, prolonged clotting times, and decreased coagulation inhibitory proteins. ELISA and Western blot were strongly positive for Borrelia infection. A liver Tru-cut biopsy revealed lobular dissecting hepatitis, but stains were negative for the Borrelia organism. Differentials included primary immune-mediated hepatitis, or immune-mediated hepatitis secondary to Borrelia, which has never been documented in the dog. Medical management included doxycycline, dexamethasone, azathioprine, ursodiol, SAMe, vitamin E, plasma, vitamin K, aspirin, and famotidine. The dog responded well to medical therapy with normalization of her liver enzymes and improvement in general attitude over the following months. This paper will discuss each of these medical therapies in more detail. Advisor: Tristan Weinkle

title: Bilateral adenocarcinomas causing hyperadrenocorticism in a dog
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 14).Naturally occurring hyperadrenocorticism is a multisystemic disorder resulting from excessive production of cortisol by the adrenal cortex. Hyperadrenocorticism is caused by either excessive pituitary ACTH secretion, as in pituitary-dependent hyperadrenocorticism (PDH), or an autonomously functioning tumor of the adrenal cortex (AT). Primary adrenocortical neoplasia has been diagnosed in 10 to 20% of dogs with hyperadrenocorticism. The prevalence of adenomas and carcinomas in dogs with functioning adrenocortical tumors is approximately equal, and the right and left glands appear to be involved with equal frequency. Bilateral adrenocortical tumors resulting in hyperadrenocorticism are exceedingly rare in dogs. In a retrospective study conducted between 1983 and 1988 of 41 dogs with hyperadrenocorticism caused by adrenocortical neoplasia, 3 dogs (7%) were found to have bilateral adrenocortical neoplasia. The following is a case report of a dog that was diagnosed with hyperadrenocorticism due to bilateral adrenocortical tumors and some of the associated complications. abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 17-18)."Koko," a three-year-old female Labrador Retriever, presented to Cornell on August 26, 2002 with suspected Lyme glomerulonephritis. While Lyme disease in dogs typically presents as acute mono/ polyarthritis, atypical presentations of canine Lyme disease - including Lyme (glomerulo) nephritis - are being recognized with increasing frequency. Lyme glomerulonephritis, more common in retriever breeds, is characterized by renal failure with protein-losing nephropathy. Histopathologic lesions consist of immune-mediated membranoproliferative glomerulonephritis, diffuse tubular necrosis, and interstitial inflammation; renal pathology is irreversible. "Koko's" history consisted of a transient single limb lameness, followed by worsening lethargy, anorexia, and polyuria. Laboratory tests revealed the presence of protein losing nephropathy and concurrent renal failure; a Lyme ELISA and Western blot were positive for antibody to infection. These results indicated glomerular injury, with Borrelia burgdorferi as a possible causative agent. Renal biopsies would be necessary to definitively diagnose the glomerulopathy, but "Koko's" thrombocytopenia and a prolonged

BMBT represented contraindications for biopsy. Advisor/Clinician: Dr. Jennifer McCabe

title: No more fat pets : canine and feline obesity, how to win
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 15-16).Obesity is the most common form of malnutrition in cats and dogs in the United States. It is estimated that 35 - 40 % of cats and 25 - 35% of dogs are obese. As in the market for human weight loss programs, there are multiple approaches to weight loss in dogs and cats. A study conducted at the Cornell University Hospital for Animals in 2001 determined an effective obesity management program involves a total wellness program comprised of three key factors as outlined in the Estra Diet Plan: an appropriate feeding regimen, an exercise program, and behavior modification for both the pet and the owner. title: Subaortic stenosis, aortic insufficiency, and patent ductus arteriosus in a dog
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 7).At presentation, Sadie was a 3-year-old, intact female, mixed-breed dog with a chief complaint of a heart murmur and a history of collapse after exertion. Examination revealed a 5/6 systolic murmur on the left, with a diastolic component, at times taking on a continuous character. Femoral pulses were weak, and examination was otherwise unremarkable. Radiographs revealed generalized cardiomegaly, hypervascular lungs, and dilatation of the aortic arch. Her differential diagnosis included subaortic stenosis (SAS) with aortic insufficiency (AI), and a patent ductus arteriosus (PDA). An echocardiogram revealed a subaortic ridge, left ventricular hypertrophy, and enlargement of the left atrium, consistent with SAS. Continuous wave Doppler showed turbulent flow in the aortic outflow tract, increased outflow velocity of 6 m/s, and aortic insufficiency. The PDA was also observed, with Doppler showing continuous blood flow through the ductus. Her final diagnosis was severe SAS with AI, and a PDA. The PDA was treated via transcatheter coil occlusion in order to resolve the PDA and the associated left ventricular volume overload which was exacerbating the stenosis. After surgery, echocardiographic evaluation showed 90% closure of the PDA, and diminished aortic outflow velocity (3.9 m/s). Her diagnosis was downgraded to mild to moderate SAS, and her prognosis upgraded to good. Advisor: Dr. Marc Kraus

title: Subepiglottic cyst in a quarter horse foal
abstract: Series: Senior seminar paper (Cornell University. College of Veterinary Medicine) Notes: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaf 8).Parker, a 5 month old Quarter Horse colt presented to the large animal medicine section of Cornell University Hospital for Animals on 10/01/02 with a 2-week history of serous to purulent nasal discharge, which had recently changed to green discharge with feed material in it.

There is no history of strangles on this farm. Endoscopic examination of the nasopharynx showed evidence of dysphagia and a mass ventral to the epiglottis. The appearance and location of the mass were consistent with a subepiglottic cyst. Thoracic ultrasound showed increased pleural echogenicity and fluid, indicating possible aspiration pneumonia. The patient was transferred to the large animal surgery section of the hospital for removal of the subepiglottic cyst. Surgical removal of the cyst was accomplished with the foal in sternal recumbancy and under general anesthesia. An oral approach was utilized, using the endoscope as a guide. The cyst was removed and sent to histopathology, the results of which were consistent with the diagnosis of a subepiglottic cyst. The foal recovered from surgery uneventfully. Advisor: Dr. J. title: The Woman's Bible
abstract: The publication of The Woman's Bible in 1895 and 1898 represented the feminist pioneer's last strike at the roots of the ideology behind her gender's subordinate role in society. In keeping with her characteristic radical individualism, Stanton attacks religious orthodoxy on a political rather than scholarly basis. This clarion call to action consists of a book-by-book examination of the Bible, placing events in their historical context, interpreting passages as both allegory and fact, and comparing them with the myths of other cultures. It endures as an extraordinary document because of the questions it addresses, the topics it covers, and its still-resonant sincerity.

title: Dynamics of Labor Market Earnings and Sector of Employment in Urban Mexico, 1987-2002.
abstract: This dissertation studies labor earnings mobility in the short-run and the structure of labor markets in urban Mexico, from 1987 to 2002.

In the first part it gauges the average earnings mobility in the economy and whether mobility equalized longer-term earnings. It also analyzes whether the mobility patterns differ by groups of the population, and whether mobility reduced longer-term earnings inequality between and within groups. The groups considered are age, education, gender, quintile of initial earnings, sector, and region groups.

In general, average earnings mobility fluctuated around zero, with the exception of the late eighties and early 2000, when individuals experienced gains, and of the years following the 1994 Peso crisis, when individuals experienced large losses. These patterns are shared by the majority of the groups of the population, with the exception of initial earnings quintile and sector groups. For these groups, the most advantaged individuals experience the largest losses, while the most disadvantaged ones experience the largest gains. Furthermore, mobility equalized longer-term earnings for the entire population during most of the periods studied, and it helped reduce longer-term earnings inequality within-groups. However, mobility only sometimes equalized longer-term earnings between groups.

The second part of the dissertation studies short-run earnings dynamics at the individual level. In particular, it examines whether mobility benefits more the initially advantaged individuals. Regression analysis shows a high level of convergence between the earnings of rich and poor. However, part of this convergence reflects transitory adjustments in earnings. In practice, most of the individuals keep their permanent advantage, leading to little convergence between rich and poor. The major exception to this finding occurs in the aftermath of the Peso crisis, when individuals with a high permanent advantage experienced greater losses than the rest of the population. The ceteris paribus impact of socioeconomic characteristics of the individual on earnings mobility is gauged. Education, gender, region and transitions between sectors are important

factors affecting earnings mobility.
The final part of the dissertation tests whether Mexican urban labor markets are segmented between formal and informal sectors. An econometric structural model of sector choice is estimated, and a strong evidence of rationing of formal sector jobs is found. The estimations also show that individuals rationed out of the formal sector would experience large gains by moving into the formal sector. CONACYT and Cornell University

title: The Effects of the Physical Environment on Physical Activity of Older Adults
abstract: With obesity-related health problems on the rise among older Americans in the past few decades, physical activity has been a major focus in the fight to overcome the obesity epidemic. The evidence to date suggests that the built environment, specifically walkable neighborhoods and features, is associated with physical activity among all ages.
This study examined the associations between environmental walkability and physical activity levels of older adults, and compared the data in two different areas of two cities: the downtown and suburban-rural sites of San Diego, CA and Ithaca, NY.
Results indicate similar physical activity levels among older adults in objectively walkable, downtown sites versus less walkable, suburban/rural sites, and suggest perceived neighborhood environment and personal factors as particularly significant factors. Specifically, neighborhoods that were perceived to have high diversity of land use mix, aesthetic attributes, and walking and cycling facilities were significantly associated with higher physical activity. Recommendations are also given regarding the importance of examining other factors such as weather, acculturation, walking purpose, and travel mode, to further understand the complexity of the relationship between the physical environment and older adults' physical activity.

title: STRATEGIC INTEGRATION, CONTRACT ADMINISTRATION, AND COMPREHENSIVE CONTRACT CAMPAIGN EFFECTIVENESS: A CASE STUDY OF THE CULINARY WORKERS UNION, HERE LOCAL 226'S 2002 COMPREHENSIVE CONTRACT CAMPAIGN
abstract: ? 2006 Paul Everett Hayes This thesis is a case study of the comprehensive contract campaign that the Culinary Union, HERE Local 226 utilized in its 2002 round of negotiations with casino operators in Las Vegas. The focus of this study is on how the comprehensive contract campaign strategy used by the Culinary Union increased the local's bargaining power in the negotiations. This case study links the success of the 2002 comprehensive contract campaign to the local's prior practices, long-term strategies, as well as its organizational structure and culture. This case study also examines how the political, social, and economic context of Las Vegas's casino industry influenced the Culinary Union's comprehensive contract campaign. It describes the interactive relationship between these external contextual factors, the local's strategic choices, and industrial relations outcomes in Las Vegas's casino industry. This case study describes how the Culinary Union, by using the organizing model of contract administration, created an organizational culture and structure that lead to increases in the quality and quantity of rank-and-file participation in the union, and how this benefited the union in its 2002 comprehensive contract campaign. In addition to citing specific examples from the 2002 contract campaign itself, this case study uses the industrial relations literature relating to union commitment and participation, in order to support this argument.

title: The Regional Cults of Thessaly
abstract: Regionalism was a defining feature of Greek society in all periods of antiquity. The implications of this regionalism for the history of religion are crucial: No two areas of the Greek world worshipped the same pantheon of gods in the same way. Regional variation was the norm. This dissertation focuses on Thessaly, a large frontier area of mainland Greece which has yet to receive systematic attention in the field of history of religion, and analyzes its regional cults. By regional cult, I mean those cults which are attested in more than one place in Thessaly but do not have a near-panhellenic distribution outside of Thessaly.
The problem is approached through a detailed study of the available literary, archaeological, numismatic and epigraphic sources. After providing an outline of major currents in Thessalian social and political history, I consider in succession the Thessalian calendar, Thessaly's "federal" sanctuaries and other regional cults. Thessaly is found to be home to a wide variety of idiosyncratic cults, including: Apollo Kerdoios, Apollo Leschanorios, Artemis Throsia, Athena Itonia, Dionysus Karpios, Ennodia, Poseidon Petraios, Themis, Zeus Eleutherios, Zeus Homoloios and Zeus Thaulios, among others.

title: UNDERSTANDING THE IMPACT OF PHYSICAL ENVIRONMENT ON THE CREATIVE PROBLEM SOLVING PROCESS AT BRAINSTORE LTD
abstract: Attn: Minnie. As per your comments I have changed the "acknowledgements" spelling and have

PDF the files.
Please note you have the signed Abstract & Title page for my thesis. Experimental research in creativity suggests an inter-relationship between the physical environment and individual creativity. But can the physical environment also influence the creative problem-solving process in organizations, which depend as much on the organization's processes as the individual people for their creative production? To begin to answer this question, this study examines the impact of the physical environment on the creative problem-solving process of a highly acclaimed, European consulting firm which specializes in "ideas". The research design employs a hybrid methodology, which combines traditional case study method with narrative inquiry. Data on how the physical environment was perceived to impact this firm's creative problem-solving process was gathered through open ended, semi-structured interviews of the organization's key employees, including the project managers, CEOs of a typical project, and also through direct, informal observation of the creative problem-solving process. Key clients from the project case were also interviewed. Published material on the organization and the organization's official Web site was used to collect additional data. All interview data was taped, transcribed verbatim, analyzed for major themes. A narrative or story was then developed using Labov's six-point framework. The narrative entitled "The Tacit Dimension" gives a real account of the client's subjective experience of the creative problem-solving process and how the physical environment influences it. Results indicate three major functions of the physical environment in supporting creative problem solving: 1) knowledge management, 2) symbolic communication, 3) functional support. The first major function of the physical environment in supporting creative process is to create and dissipate knowledge to both employees and clients alike, about the functioning of the creative problem solving process ? knowledge management The second major function employs signs and symbols in the environment to build appropriate expectations and mindsets which support a healthy creative problem solving process ? symbolic communication. The narrative shows that the clients depended on the symbolism embedded within the physical environment of the organization as an assurance of its creative ability thereby making them more receptive to nontraditional procedures and building trust in the process. The symbolic communication also promoted the creative problem solving abilities in the employees. Lastly, the environment should be functional to support idea generation by allowing adequate flexibility ? functional support. By providing spaces that efficiently support the work processes but are also flexible enough to adapt and improvise, creatively and functionally empowers the employees to generate creative ideas.

title: A Two-Sex, Age-Structured Population Model in Discrete-Time
abstract: This work examines how the life history parameters effect the stable age distribution of the different classes and compares these results with the standard single sex model. The conditions necessary for a population projected forward in time to reach a stable age distribution is analyzed. The conditions for existence are dependent on the nature of the mating function, i.e. the rate at which the two sexes find each other and mate. In addition, the assumptions under which these mating functions are constructed have important implications for the dynamics of the population and ultimate age distribution, stable or not. An analysis of when including both sexes becomes essential to the understanding of reproductive strategies, examination of whether a population fulfils the necessary assumptions about mating to make certain statements about population growth, growth rates and relative fitness, and outlining an accessible approach to modeling the joint life histories will be of practical value. Toward this end, a framework for discrete-time two-sex models with age structure is developed. In addition a marriage (mating) function based on an analogy with foraging theory and preferences based on the predispositions of one age group for another is proposed. Some of the properties of these models and their solutions are also investigated.

title: Workforce Alignment, Human Resource Scalability, and Small Business Sales Growth
abstract: This study contributes to the field of strategic human resource management by providing initial insights into the extent to which, and the conditions under which, workforce alignment leads to higher levels of firm performance. Using data collected from the CEOs of 196 small businesses, I develop a measure of workforce alignment and demonstrate that workforce alignment mediates the relationship between high-performance work system use and sales growth. I also show that firms that achieve workforce alignment through either internal scalability or external scalability (but not both) are more likely to obtain high sales growth than firms that achieve workforce alignment though HR stability. Finally, I reveal other circumstances such as involuntary turnover, contract worker use, and market volatility that moderate the relationship between workforce alignment and sales growth in expected and surprising ways. title: "DISCOVERING" CAMBODIA: VIEWS OF ANGKOR IN FRENCH COLONIAL CAMBODIA (1863-1954)
abstract: This dissertation is an examination of descriptions, writings, and photographic and architectural reproductions of Angkor in Europe and the United States during Cambodia's colonial period, which began in 1863 and lasted until 1953. Using the work of Mary Louise Pratt on colonial era narratives and Mieke Bal on the construction of narratives in museum exhibitions, this examination focuses on the narrative that came to represent Cambodia in Europe and the United States, and is conducted with an eye on what these works expose about their Western, and predominately French, producers. Angkor captured the imagination of readers in France even before the colonial period in Cambodia had officially begun. The posthumously published journals of the naturalist Henri Mouhot brought to the minds of many visions of lost civilizations disintegrating in the jungle. This initial view of Angkor proved to be surprisingly resilient, surviving not only throughout the colonial period, but even to the present day. This dissertation seeks to follow the evolution of the conflation of Cambodia and Angkor in the French ?narrative? of Cambodia, from the initial exposures, such as Mouhot?s writing, through the close of colonial period. In addition, this dissertation will examine the resilience of this vision of Cambodia in the continued production of this narrative, to the exclusion of the numerous changes that were taking place in the country. Finally, I will be using French colonial archival sources in order to examine measures that were taken by the French colonial administration in order to take greater control over the area that constituted the Angkor Historical Park, and to implement preventative measures and physical alterations designed to keep the view of Angkor aligned with this narrative.

title: Religious Participation Effects on Mental and Physical Health
abstract: The first section of the dissertation provides a review of the literature, conceptual distinctions between religiousness and spirituality, and four key hypothesized pathways identified and categorized from the literature, posited to explain the effects of religious participation on health.

The second section investigates the relationship of religious participation to physical health, mental health and depression and the mediating behavioral pathway of cigarette and alcohol use. The study focuses on a sample of 2,102 individuals followed from 1979 to 2000, utilizing data from the National Longitudinal Survey of Youth 79 (NLSY79). The main findings are the following. Cross-sectional analysis revealed a positive U-shaped relationship between religious attendance and physical health in the year 2000, controlling for sociodemographic variables of gender, race, marital status, education, number of children living in a household, work amount, and income. Attendance levels of once per week to infrequent were related to better physical health scores. Attendance among individuals of low socio-economic status (SES) was associated with better physical health compared with no attendance. African Americans reported better mental health and lower depression scores with higher attendance levels compared to no attendance; Caucasians showed the opposite trend. Examining the data longitudinally from 1982 to 2000, early attendance in young adulthood was found to be positively associated with better mental health and less depression in mid-adulthood, controlling for key sociodemographic variables. The behavior of cigarette smoking frequency was a mediator between the relationship of religious attendance and depression, controlling for key sociodemographic variables. Alcohol abuse/dependency and heavy drinking showed evidence of mild mediation. Attendance in young adulthood was protective against alcohol abuse/dependency, heavy drinking and smoking in mid-adulthood.

In addition, the dissertation includes the development of a framework for future qualitative analysis of exploratory interviews with professionals at international humanitarian organizations on how religious beliefs

and practices of a targeted population are taken into account in health projects. Major themes explored are conceptualizations of religiousness, spirituality and health, theorized mediating pathways, field experiences and institutional policies.

Overall this research provides evidence to support the relationship between religious participation and mental health, depression and physical health.

title: MODIFYING EFFECTS OF PARTICIPATION IN FEDERAL CHILD NUTRITION PROGRAMS ON THE DEVELOPMENTAL CONSEQUENCES OF HOUSEHOLD FOOD INSECURITY FOR CHILDREN
abstract: Committee Chair: Edward Frongillo Committee Members: David Pelletier, Martha StipanukFood insecurity remains a persistent public health problem for children in the U.S. and is thought to have consequences for child physical, social and academic development. The School Breakfast Program, the National School Lunch Program, and Supplemental Food and Nutrition Program for Women, Infants and Children (WIC) are federally funded programs intended to avert food insecurity and its consequences for children. These nutrition programs have also been associated with child physical, social and academic developmental outcomes. Further research is needed to investigate the complex relations between variables and to establish greater plausibility that associations are causal in nature. This study investigated the causal effects of household food insecurity and child nutrition program participation by using longitudinal data and statistical methods to account for potential bias. Fixed-effects modeling was utilized to minimize bias resulting from selection to participate and to take advantage of dynamic changes in household food insecurity status and program participation between kindergarten and 3rd grade. Household food insecurity, independent of household income and other child- and household-level factors, was associated with poorer social skills and reading performance development among girls, and with greater weight gain among boys. National School Lunch Program participation was associated with better mathematics and reading performance for children. The effects of National School Lunch Program participation were stronger for children with greater socioeconomic need compared to those with less socioeconomic need, suggesting that food assistance participation may impact child development by modifying the effects of stress-related hardships. Neither school breakfast participation nor school lunch participation was associated with greater weight gain. In conclusion, food insecurity may exert its detrimental effects through nutritional and non-nutritional (i.e., stress-related) mechanisms. Similarly, school nutrition programs may protect children against the effects of food insecurity through nutritional and non-nutritional mechanisms. Further research into potential mechanisms underlying these associations is warranted. Policy implications of the findings are discussed.U.S. Department of Agriculture Economic Research Service cooperative agreement 43-3AEM-3-80104

title: On the Use of Diffraction in Quantifying the Structure and Micromechanical State of Polycrystalline Materials
abstract: This dissertation essentially consists of three related studies concerned with quantifying the structure and micromechanical state of bulk polycrystalline materials. They are contained in Chapters 1, 2 and 3, which may be read independently. The emphasis is on the development of new methods for the analysis and interpretation of generalized pole figure data.

Chapter 1 contains an expanded version of a manuscript my coauthors and I have submitted for review [3].

In it, a robust method for obtaining an orientation distribu- tion function (ODF) from pole density functions (PDFs) is presented. The method uses the gradient norm of the ODF for conditional control of the solution in the context of a constrained minimization problem. The introduction has been expanded to include a detailed definition of the ODF and PDF. Several additional sample applications of the method have also been included, as well as several appendices that elaborate on the mathematical formalism of orientations and other technical aspects of the implementation.

Chapter 2 is largely similar to a second manuscript that has been provisionally accepted for publication in the Journal of Applied Crystallography [5]. In it, the methods developed in Chapter 1 have been adapted to obtain a lattice strain distribution function (LSDF) from strain pole figures (SPFs). The proposed SPF inversion method utilizes conditional control formulated independently of any kinematic linking assumptions.

In Chapter 3, a methodology is presented for extracting generalized pole figure data from 2-d powder diffraction images. An example application of this analysis, along with the methods presented in Chapters 1 and 2, is provided using data obtained via an in situ loading/diffraction experiment performed at the Cornell High Energy Synchrotron Source.

The fourth and final chapter provides a summary of the salient scientific contributions of this dissertation, along with proposed extensions of the research. Together, the 3 methods presented in this dissertation provide a set of tools for characterizing the structure and micro-mechanical state of polycrystalline materials at the bulk scale. Most importantly, the resulting distributions are suitable for direct comparison to the predictions of structure-based models of polycrystalline materials.GRA under AFOSR Award #F49620-02-1-0047 TA under the Sibley School of Mechanical & Aerospace Engineering CSIP GK-12 teaching fellowship under NSF Award #0231913

title: Applications of Spectral Analysis to Hydrology and Chemical Transport
abstract: Tammo Steenhuis, M. Todd Walter, Wilfred Brutsaert, Proxy: Jean Yves Parlange This dissertation investigates and describes several ways of using spectral analysis as a frequency domain approach for mathematical hydrological modeling. Hydrologists have used spectral analysis for modeling in the past in various ways. However, one of the novelties of this research is that it is a simplification of previous techniques, which involved acquiring information about several parameters. Many of these parameters are time consuming to collect as data or are only estimated using intricate mathematical equations. In the first chapter the relationship between stream discharge and wetland water elevations in a watershed located in North Madison, CT was successfully modeled using exclusively independent measurements of discharge and wetland water elevations. This relationship was previously modeled using six parameters, three of which had to be estimated for their instantaneous behavior. Using the methods developed in this study conserved time and effort and produced the same results. The second chapter describes how to model discharge with measures of water table elevations in a runoff source area using the same techniques described in the first chapter. Using water table elevations across a lower part of the hillslope and in a near stream area of

Townbrook watershed in the Catskills of New York, spectral analysis was used to determine the rate of water transport at these various locations and to successfully model stream discharge. The third chapter describes a method of using spectral analysis to determine chemical transport throughout a catchment area. Three watersheds were analyzed to describe a relationship between wet deposition and stream water concentrations of chloride (Cl) and nitrate (NO3). Spectral analysis was also used to define a distribution of travel times associated with the transport of input concentrations of Cl, NO3, ammonium (NH4), total Phosphorus (TP), total dissolved phosphorus (TDP), total particulate phosphorus (TPP), soluble reactive phosphorus (SRP) suspended solids (SS), total kjeldahl nitrogen (TKN), and total organic carbon (TOC). All of these studies combined indicate that spectral analysis is a tool than can be of further use in many aspects of hydrology and in studies of water quality and chemical transport.NSF

title: Random Multiple Access Communications on Multipacket Reception Channels
abstract: By applying multiuser detection techniques, receivers today can decode multiple packets transmitted simultaneously over a channel. Known as multipacket reception (MPR), this presents a physical layer model significantly different from the one that practical design and theoretical analysis of many network protocols have traditionally assumed. The principal objective of this study is to consider the design of efficient multiple access communication systems for this new model.

Specifically, we investigate the maximum stable throughput attainable with decentralized control using channel sense multiple access (CSMA), which has not previously been studied with MPR. We show CSMA provides throughput gain over slotted ALOHA (S-ALOHA), the non-channel-sensing protocol of choice. However, we also find that this gain diminishes as the physical layer strength increases, thereby diminishing the need for channel sensing.

Searching for improvements, we investigate the generalized CSMA protocols which allow new transmissions to begin even when the channel is already in use, provided the usage level is below capacity. In addition, we also analyze the effects of implementing collision detection (CD). We find that generalized CSMA provides a moderate improvement in throughput compared to the significant improvement that CD affords. This is attributable to CD's shortening of the time that corrupted transmissions occupy the MPR channel, thus increasing any new transmission's success probability. As generalized CSMA/CD offers little improvement over the simpler classical CSMA/CD, we conclude the latter suffices for satisfactory improvement. We also present a novel CD method applicable not only to wireline but also to wireless networks.

Finally we investigate the general multiaccess protocol's capacity with MPR. We find that, if the expected number of successes is maximized in the limit of infinitely many simultaneous transmissions, then S-ALOHA and CSMA are optimal. We also establish an upper bound on the throughput of decentralized multiaccess protocols operating on channels not satisfying this condition. The gap between the channel capacity and said upper bound is informative about the cost of decentralization. This gap also narrows as the physical layer's ability to separate packets gets stronger, thus corroborating existing theories that suggest there is less need for multiple accessing for strong MPR channels.NSF Grants No. CCR-0330059 and CCR-1980616, the School of Electrical and Computer Engineering at Cornell University and the Symbol Technologies Fellowship.

title: Digital Legal Information: Ensuring Access To The "Official" Word Of The Law
abstract: This article was published in Cornell Law Forum, Vol. 26 No. 1, July 1999, 11-14.In the United States today, digital versions of current decisions, bills, statutes, and regulations issued by federal and state entities are widely available on publicly accessible Internet Web sites. Worldwide, official legal information issued by international organizations and foreign governments is also becoming available on the Web. However, there are currently no standards for the production and authentication of digital documents. Moreover, the information is sometimes available only for a short time and then disappears from the site. Most of that digital information provides only a right of access, and no ownership, or control over the data, unless it is downloaded on a server, or stored on a CD. The long-term access to digital legal information is a matter of concern. What is at stake is the transmission of official documents, "the word of the law," to future generations.

title: Nau te rourou, Nau te rakau: the Oceanic, Indigenous, Postcolonial and New Zealand comparative contexts of Maori writing in English
abstract: While there is increased academic interest in Maori writing in English, both inside and outside Aotearoa, little of the current scholarship has attended self-consciously to the issue of critical methodologies that pertain to this material. This dissertation explores, in theory and in practice, the comparative 'umbrellas' within which Maori texts are most often considered. Holding that a broad definition of what counts as a 'text' is crucial to Maori literary studies, I identify the intersections and disconnections of Maori writing with Oceanic, Indigenous, Postcolonial and New Zealand literary and critical works.
This project draws together critical work in the areas of Indigenous, Minority, Postcolonial, New Zealand and Pacific literary studies, along with research about critical Maori academic methodologies such as 'Kaupapa Maori' scholarship. A specific whakatauki ('Nau te rourou, naku te rourou, ka ora ai te iwi; nau te rakau, naku te rakau, ka mate te hoariri') provides the structure of the project and, thereby, the methodology by which I explore the possibilities (rourou), and also the limitations (rakau), of reading Maori writing in English within each of these four comparative critical contexts. Considering these texts comparatively has implications for the 'categories' we call Oceanic, Indigenous, Postcolonial and New Zealand, as well as, indeed, for the conceptualisation of 'Maori.' Maori writing in English is not reducible to any one of the comparative frames I explore: it is Pacific/ Oceanic, but also Postcolonial; it is Indigenous but also New Zealand. I propose that none of these critical frameworks is singularly sufficient, and yet the intersection of each with the respective preoccupations/ contexts/ histories/ politics/ thematics in Maori writing means that none of them is removable either. At the same time, I point to potential flaws, problems, disconnects and invisibilities in and between the various frameworks, and I suggest ways in which these - especially Postcolonial and New Zealand - might make critical amends for their exclusions. As well as examining the features of these specific frames, I foreground and preliminarily theorize the very process of intra-linguistic comparison on which this kind of criticism is dependent, and reflect on the unanticipated prominence throughout the chapters of the complex relationship between literary studies, Maori texts, Maori communities and the experience of Maori students in the literature classroom.

title: An Examination of the Climatology and Environmental Characteristics of Flash Flooding for the Binghamton, New York County Warning Area
abstract: Committee members: Dr. Arthur DeGaetano, Dr. Stephen Colucci, Dr. Wilfried Brutsaert; proxy member Dr. M. Todd Walter This study uses the publication Storm Data to compile a climatology of flash floods reported in the Binghamton, NY (BGM) County Warning Area (CWA) of the National Weather Service (NWS). This work reveals diurnal and seasonal trends in flash flood frequency across the CWA. Also evident is a spatial disparity in the number of flash flood reports in different portions of the CWA. In some cases, adjacent counties with similar topography reported a dissimilar number of flash floods. Because those counties reporting a strikingly smaller number of floods tended to be less populous than the neighboring counties reporting a larger number of events, a reporting bias may be to blame. Possible reporting biases aside, regional differences in the number flash flood reports across the CWA suggest that some areas are more prone to flash flooding than others.

The more significant component of the project is to analyze the environmental characteristics of flash flood events in the BGM CWA in order to refine flash flood forecasting procedures. BGM's flash flood forecasting checklist prior to this study was based on parameters and thresholds found to be significant at nearby NWS offices, rather than site-specific for BGM. Additionally, the study seeks to identify any differences between flash flood and non-flooding heavy precipitation events so as to reduce the false alarm rate. Quantitative (discriminant analysis) and qualitative (composite map) analysis has been performed to discover parameters and combinations of parameters that differ between flood and non-flood events.

The datasets are comprised of warm-season, non-tropical, meteorologically-induced flash floods, heavy precipitation events, and days in which flash flood watches were issued but flash flooding did not occur. That is, events such as dam breaks, ice jam floods, and snow melt events are excluded from the study. Events resulting from tropical systems are excluded, as the concern is primarily to identify those conditions associated with convective warm-season events. Additionally, a data set comprised of a random year assigned to the calendar date of each flash flood event is included to represent a climatology based on the annual distribution of floods.

The results indicate that flash floods and non-floods differ most significantly in antecedent precipitation and antecedent soil moisture. Flash floods appear more likely to occur during periods of above-normal precipitation than non-floods. Wind direction at 850 mb and storm motion direction also show differences between flood and non-flood events. In particular, an easterly to southeasterly 850-mb wind or storm motion is almost always associated with flash flooding. Lastly, some parameters that had been included on the Binghamton checklist were found to be unreliable. For these parameters, the threshold values on the checklist were infrequently exceeded during flash floods, or these thresholds were more likely to generate false alarms of non-events than to warn of a flash flood.Cooperative Program for Operational Meteorology, Education, and Training (COMET) Outreach Project

title: Assessing the Impact of Interannual Climate Variability on New York City's Reservoir System
abstract: New York City's reservoir system supplies about nine million residents with approximately 1.3

billion gallons of water each day. Such dependence on the system requires a thorough understanding of the natural controls of its variability, as well as that of regional streamflow and precipitation. Prior studies suggest that climate variability in the Northeast depends upon large-scale northern hemisphere atmospheric and oceanic circulation patterns. In this study, the impact of large-scale climate variability on New York's reservoir system and whether interdecadal climate variations alter the influence of shorter interannual climate modes on water availability is examined. Also of importance is the interaction between these atmospheric oscillations and how these relationships might change during the different climatic regimes. Explored in this study are the influences of the Pacific Decadal Oscillation (PDO), El Nino-Southern Oscillation (ENSO), Pacific-North American Oscillation (PNA), North Atlantic Oscillation (NAO), and Atlantic Multidecadal Oscillation (AMO) on precipitation and hydrology in New York City's watershed. The direct impact of the large-scale oscillations on the quantity of water in New York's seven-reservoir system is also investigated. Statistical analysis has been performed on the data for 1951-2004, during which all data sets were available and, separately, for positive and negative PDO phases (1977-97 and 1951-76/1998-2004, respectively). The interactions between hydrological/meteorological factors and the reservoir system levels in the separate phases have also been examined. Statistically significant differences in most interactions have been found between the separate PDO phases. The results of this study indicate that the potential for predicting reservoir behavior exists. Although statistically significant, the relationships are not well enough understood to prescribe using this information for watershed management at this point. However, the study results do warrant further exploration of the relationships between atmospheric/ oceanic oscillations and the reservoir system for practical watershed management applications.

title: A Tale of Two: Reconstructing Climate from Tree-Rings of the North Aegean, AD 1089-1989, and Pleistocene to Present: Dendrochronology in Upstate New York
abstract: Warren D. Allmon, Peter I. Kuniholm, Arthur T. DeGaetanoA TALE OF TWO: RECONSTRUCTING CLIMATE FROM TREE-RINGS OF THE NORTH AEGEAN, AD 1089-1989, AND LATE PLEISTOCENE TO PRESENT: DENDROCHRONOLOGY IN UPSTATE NEW YORK Carol Bliss Griggs, Ph.D. Cornell University 2006 In the first two chapters, oak samples from the north Aegean (39-42 degrees N, 22-37 degrees E) are used in dendroclimatological research. In the first chapter, the precipitation of May and June is shown to be the primary limiting factor in annual ring growth and is reconstructed from a tree-ring chronology of historic building and modern forest samples, AD 1089 to 1989. Removing all but the high-frequency variability plus normalizing the oak data sets gives an accurate regional precipitation reconstruction. The low-frequency variance in the same chronology filtered with a 24-kernel Gaussian filter explains 91.6% of the variance in the filtered North Atlantic Oscillation (NAO) May index, 1915-1967, but not before that period. In the second chapter, the oak chronology is divided into three grids, west to east. The May NAO is recorded in the western grid chronology from 1833-1967. Using the similarities and differences in the three grids' filtered oak chronologies over time as indicators of the effect of the May NAO on the region, the low-frequency May NAO is reconstructed for AD 1181 to 1967. The third and fourth chapters examine the tree-ring record of samples collected in New York State (41-45 degrees N, 73-80 degrees W). Over 30 tree-ring chronologies that represent various windows of time from 15,000 years ago to the present have been constructed from tree-ring measurements of wood collected from six modern woodlands, seven historical structures and timbers, and eight river, stream, and pond sediments. Chapter 3 focuses on the oldest samples dating from the late Pleistocene Epoch, including wood sections found in three mastodon excavations in New York State. The oldest wood macrofossils are spruce and their respective radiocarbon dates reflect the southeast to northwest retreat of the ice sheet and subsequent migration of arboreal species across New York

State. Chapter four is a compendium of the collected wood samples from the Holocene Epoch. Regional modern and historic chronologies date from AD 1625 to 2004 for oak, AD 1593 to 2003 for hemlock, and AD 1681 to 1848 for pine. Floating chronologies date throughout the Holocene, from ca. 9500 BC to the mid-fourteenth century AD.NSF BCS-0314282 and SBR-9905389

title: Making Time: Toward a Historical Materialist Fashion
abstract: This thesis analyzes the social significance of the abstract phenomenon of fashion, with reference to sartorial examples from the Fashion industry, using Walter Benjamin's writing on surrealism and fashion as a theoretical model. Examples primarily come from "deconstructive" designers including Martin Margiela and Rei Kawakubo, and post-deconstruction designers such as Jun Takahashi and everyday wearers who make or remake their own garments at home. Benjamin's arguments are presented in terms of his wider political project, demonstrating the continued relevance of his thought in understanding contemporary aesthetic, commercial and material practices. In addition, the thesis refers Georg Simmel and Ernst Bloch, as well as historian Pierre Nora, in order to define the relations between past and present, making and wearing, and production and consumption in "deconstructive" garments.
The thesis accompanies an exhibition of clothing, texts and images entitled "Made with Love: Fashion, Craft, and Other Beautiful Illusions," which was held from May 21st to 27th, 2005 in an empty retail space in Ithaca, New York. Mounting the show and collecting feedback from it formed the concepts in the thesis, while the writing underpinned the ideas in the show. The simultaneous exploration both in writing and fashion gives the rhetorical argument immediate practical relevance, while providing the practice with a theoretical armature, already far more composed than is usual in fashion design. The interdisciplinary nature of this study links and expands the theoretical study of material culture and the practice of idea-led design.

title: Broken Idols: Migration, Globalization, and Cultural Change in Honduras
abstract: Terence Turner, Dominic Boyer, Maria Cristina Garcia This is an ethnographic study of a coffee-growing community in Honduras, which was in the midst of a transition to economic reliance on migration to the United States from 2001 to 2004, when field research was conducted by the author. The author focuses on the origins and contemporary dynamics of Honduran emigration, and explores the impact of emigration on local society and culture. He argues that migration has led to a profound sense of confusion within a single community, identified by the pseudonym of "La Quebrada." In this town, migration is generally described in negative terms, and migrants are often seen as the cause of socioeconomic crisis, rather than its victims. The author describes two local responses to emigration in La Quebrada: the rise of evangelical churches and the establishment of a fair trade coffee cooperative. Evangelical churches offer solutions to many of the social problems caused by emigration, and fair trade production offers an economic alternative to migration for coffee farmers. He draws a parallel between local criticisms of migrants as the source of social decline, the explanations of social crisis offered by the evangelical churches, and the philosophy of fair trade. In each case, people express concern about the manner in which their community has been integrated into the global economy, but they believe that individual behavior is the only viable source of social reform. This emphasis on the individual, abstracted from social totalities, limits the political potential of these movements. The author concludes that these movements articulate a sense of popular anxiety over the community's future, and a desire to refashion society for the collective good. However, the forms that these popular responses have taken is based on a belief that no political institution can mediate between the individual and the global market. The tendency to conceptualize sociopolitical reform in individualized terms, he argues, reflects macro-level cultural changes that have occurred around the globe in the past twenty years.

title: ETHNOGRAPHY OF INFANT FEEDING IN SUB-SAHARAN AFRICA: CASE STUDIES IN THE CONTEXT OF HIV/AIDS AND NEWBORN CARE
abstract: The three ethnographic case studies described in this dissertation provide a cultural description of breastfeeding behavior with respect to HIV/AIDS and newborn care, and with a focus on early infancy.
Study 1: Influences on infant feeding decisions were investigated in-depth interviews with a sample of 22 HIV-positive mothers from Kwa-Zulu Natal, South Africa. Five themes were identified: social stigma of HIV infection; maternal age and family influences on feeding practices; economic circumstances; beliefs about HIV transmission through breastmilk; and beliefs about the quality of breastmilk compared to formula. Mothers knew that breastmilk can infect the infant with HIV, but a dominant theme was that breastmilk protects children and is superior to formula.
Study 2: Local feeding practices for the newborn, and how these "fit" within the repertoire of newborn care giving practices were assessed in Pemba Island, Tanzania. In-depth interviews were conducted with 13 peri-urban mothers and 30 rural mothers. Beliefs underlying neonatal care-giving practices included: a) fear of maternal and/or newborn death at the time of delivery; b) vulnerability of the newborn; c) ritual pollution after childbirth and d) feeding strategies believed to enhance newborn health and survival. From a pile sort exercise conducted with a literate sub-sample, infant feeding was found to be conceptualized as

distinct from other newborn care giving practices.
Study 3: The 30 rural women from study 2 were provided with advice to improve feeding behavior during pregnancy. Their responses to the advice were assessed postpartum. Breastfeeding newborns was part of cultural expectation and practice, but exclusive breastfeeding was not. In all three communities, breastfeeding is highly valued and is culturally normative. The first study results offer a glimpse of the forces that influence HIV positive women as they attempt to make an informed choice about feeding their infants. Results from the second study suggest that interventions could specifically target feeding without having to affect other domains of newborn care. Results from the third study offer guidance for designing education messages for promoting exclusive breastfeeding during the first few weeks of infant life. Taken together, the three studies provide useful information for breastfeeding promotion activities.

title: Contributions of Attentional and Behavioral Regulation to Socioemotional Adjustment and Early Academic Success Among Head Start Graduates
abstract: I am grateful to C. Cybele Raver, the Principal Investigator of the Cornell Early Social Development Study, for providing me with the opportunity to use and collect data related to this longitudinal project. I would like to thank the teachers throughout western New York State who gave their time to assess classroom behaviors, the school administrators who made report card collection possible, and the children and parents who participated in the Early Social Development Study. The multiple pathways linking 4-year-olds' self-regulation to their adjustment (defined as teacher-reported socioemotional functioning and academic achievement) among a sample of children from ethnically and geographically diverse low-income families (Time 1 N = 163) were examined at two time points over the transition from preschool to first grade. Self-regulation was defined in terms of attentional and behavioral regulation and inhibitory control. Three research questions were investigated in separate papers. In all analyses, demographic factors such as maternal age, education, workforce entry, family income category, and child age were statistically controlled.
In the first paper, I investigated whether self-regulation mediates the relationship between caregivers' limit-setting practices and children's adjustment. Findings indicate that the extent to which children were able to engage in attentional and behavioral forms of regulation fully explained the relations between limit-setting practices and early reading achievement in first grade. Contrary to hypotheses, attention and behavior regulation did not mediate the effect of limit-setting on children's socially competent, externalizing, and internalizing behaviors.
In the second paper, I tried to explicate the known relations between inhibitory control and adjustment by examining the mediating role of behavior regulation measured longitudinally at Time 1 and concurrently at Time 2. Support was found for the mediating role of behavior regulation in the relations between inhibitory control and children's reading and writing achievement. Comparable support was not found for children's socioemotional outcomes. Limited support was detected for the indirect effect of inhibitory control through behavior regulation on social competence, but only for children from married families at Time 1.
In the third paper, I examined whether negative emotionality (defined as anger/frustration) moderated the relationship between self-regulation and child adjustment. Results suggest that negative emotionality moderated the relationship between attention regulation and children's reading grades: Children with fewer attention regulation skills and higher levels of frustration received lower reading grades compared with peers who also displayed few attention regulation skills but were low in frustration at Time 1. Contrary to predictions, the paths from behavioral regulation to achievement did not vary as a function of child frustration. For all three papers, policy implications are discussed. This dissertation research was supported in part by a Predoctoral Kirschstein-National Research Service Award (NRSA) from the National Institute of Mental

Health, 1 F31 MH68089-01A1 (2003-2004), a Dissertation Research Award from the American Psychological Association's Science Directorate (2003), a Flora Rose Fellowship (2002-2003), and a Dissertation Grant (2003) from the College of Human Ecology at Cornell University, and a Summer Fellowship (2002) from the Department of Human Development at Cornell University. The Cornell University Graduate School, the College of Human Ecology, and the Department of Human Development funded travel to professional meetings, conventions and conferences to present preliminary thesis findings (2003-2004).

title: Answering Complex Queries in Peer-to-Peer Systems
abstract: Peer-to-peer (P2P) systems provide a robust, scalable and decentralized way to share and publish data. However, most existing P2P systems only support equality or keyword search queries. We believe that future P2P applications, such as digital libraries, resource discovery on a grid, or military applications, will require more complex query functionality, as users will publish semantically rich data.

Towards the goal of supporting complex queries in P2P systems, this dissertation focuses on developing index structures that allow fast access to distributed data. We introduce first a general modular indexing framework that identifies and separates the different functional components of a P2P index structure. One of the benefits of such a framework is that it allows \eat{tailoring the index structure to the needs of the different applications, with different requirements. Another benefit is that it allows }reusing the existing algorithms for different components rather than implementing everything anew. We can thus concentrate on creating algorithms that provide new functionality.

We introduce P-Tree, a distributed fault-tolerant index structure. P-Trees support range queries in addition to equality queries in P2P systems in which each user (peer) publishes a small number of data items. We describe algorithms to maintain a P-Tree under insertions and deletions of data items/peers, and evaluate its performance using both a simulation and a real distributed implementation. Our results show the efficacy of our approach.

We introduce then P-Ring, a novel index structure based on our framework, that supports both equality and range queries, is fault-tolerant, efficiently supports large sets of data items per peer (as opposed to P-Tree), and provides guaranteed logarithmic search performance in a stable system.

In a thorough Wide Area Network experimental study we evaluate the performance of P-Ring and \eat{ we quantify the performance trade-offs of the different system components. We also }compare P-Ring with three other P2P index structures, Chord, Skip Graphs, and Online Balancing, implemented in the context of our indexing framework. Our performance results indicate that P-Ring outperforms Skip Graphs in terms of both query and maintenance cost. P-Ring offers a better load balance than Online Balancing, at a lower cost. P-Ring outperforms Chord in terms of search performance and supports a larger class of queries, with a low overhead.

title: Non-marital Births, Poverty and Welfare Reform
abstract: The central question this paper addresses is what effect will the provisions to reduce non-marital births in the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 have on non-marital birth rates? Data from state waivers prior to the 1996 legislation is used to capture the policy environment in which a non-marital birth occurred in several states between 1992 and 1996; and to assess variation(s)

in fertility behavior among those states. Creation of policy variables based on state waiver data allowed for further estimates of the impact (in selected states) of the specific policy provisions in the PRWORA aimed at reducing out of wedlock childbearing, and subsequent welfare receipt.

A review and summary of research regarding the strength of association between non-marital child bearing and welfare receipt is provided and includes both a brief review of general literature about non-marital births and a more focused review of literature specific to the antecedents of non-marital births. The empirical analysis in this work utilizes data from the Urban Institute's National Survey of American Families (conducted in 1997 and 1999 after the Federal legislation was implemented) to examine two questions: whether or not the policy provisions and program efforts from the PRWORA accounted for the differences in determinants of non-marital births for teenage women and women over the age of twenty; and whether or not emphasis should have been placed on reducing teen pregnancy as a means to reducing welfare receipt and poverty in the 1996 PRWORA. Regression analysis estimated the impact of demographic variables on non-marital births in addition to the effect of specific welfare policies in selected states, and shows that the determinants of a non-marital birth differ by age of the mother, and the focus on reducing teen pregnancy is warranted despite the fact that adolescent women account for only 30% of non-marital births. Three areas in the legislation that require further analysis are identified and recommendations for addressing these shortcomings in the legislation are also offered to increase self-sufficiency of poor families in the context of legislative reauthorization, and future reform efforts.

title: Violent Cities: Umberto Lenzi's Polizieschi and B-Movie Fascism
abstract: This paper examines the critical failure to treat the Italian cop film, or poliziesco, as anything other than a poor cousin of the American crime film. I argue that such a blindness has prevented discussions of the cop film's intervention in larger cultural narratives of postwar Italy, which in turn makes urgent a discussion of the ways the Italian genre departs from the Hollywood prototype. Where most studies of Italian paracinema have noted the generic schizophrenia of Italian trash, the blurred boundaries among all the favored genres of Bruno Mattei, Umberto Lenzi, Sergio Martino, and Ruggiero Deodato, this paper focuses on the cultural and critical worries that the polizieschi embody and their relation with the theoretical and historical elaborations of gender that occurred in the same period in Italy. A study of the Italian cop film and one of its signature directors provide a number of access points to a more wide-ranging examination of trash cinema and its place within Italian cultural formations of the postwar period, in particular with regard to the discourse of virility.

title: Teorie dell?avanguardia tra materialismo e idealismo

abstract: Paper presented February 17, 2006The paper's opening paragraph follows:

? ormai opinione unanime nella critica mettere in relazione diretta l?avvento della moderna societ? capitalista con la nascita delle avanguardie. (tra gli altri Asor Rosa 2004: 43; B?rger 1990: XI; Calinescu 1977; 96; Curi 2001: 106; Ferroni 1996: 117-118; Murphy 1999: 6; Mann 1991: 7; Poggioli 1962: 124; Rossi-Landi 1994: 104 Russell 1985: 5) Questo ? l?orizzonte discorsivo che prendo in considerazione. In generale, sembra legittimo affermare anche che l?avanguardia coglie e rielabora le contraddizioni del capitale prima elencate. Storicamente tende ad un universalismo che supera le mere connotazioni nazionali. Questo ? valido sia per quanto riguarda gli obiettivi pragmatici delle varie poetiche ? si veda l?idea di ?alfabeto stellare? di Velemir Chlebnikov (1885-1922) ? sia per la dimensione transnazionale degli stessi movimenti ? il surrealismo, ad esempio, contamina vari sistemi letterari dell?Europa continentale, fino alle isole Canarie e all?America Latina. (Morelli 1998: 183-208) L?avanguardia inoltre si confronta e a volte assimila l?impatto sociale e antropologico dell?innovazione tecnologia. Secondo la prospettiva dei rispettivi movimenti, a volte ne assume in pieno il carattere migliorista ? ? il caso della ?modernolatria marinettiana? (Sanguineti 2001: 36) ? a volte, le oppone un rifiuto integrale, denuncia l?alienazione che ha cancellato il sogno di un?epoca pi? piena ? ? il caso dell?espressionismo di Georg Trakl (1887-1914). Infine, ma questa ? una caratteristica che taglia diagonalmente l?arte moderna, la produzione e il recupero del nuovo passa attraverso una distruzione necessaria della tradizione artistica preesistente ? tra i tanti possibili esempi, citerei la veemenza della polemica anti-passatista dei futuristi.Italian Studies Colloquium @ Cornell

title: Nucleus-encoded Factors Involved in 5' and 3' Processing of Chloroplast Transcripts in Chlamydomonas reinhardtii
abstract: Chloroplast RNA maturation and degradation are regulated by nucleus-encoded factors that interact with sequences and structures within the RNA. Although several transcript-specific factors have been identified, those involved globally in RNA metabolism, apart from ribonucleases, have mostly remained elusive. Three pleiotropic nuclear mutations, mcd3, mcd4, and mcd5, appear to affect this global RNA metabolism, since they impact 5' end and 3' end maturation of two or more chloroplast transcripts in Chlamydomonas reinhardtii. These mutants were initially isolated as photoautotrophic suppressors of the 5' UTR mutations LS2 and LS6, which destabilized petD transcripts, but analysis of transcripts from 32 chloroplast genes showed that mcd3 and mcd4 displayed altered RNA transcript patterns for 17 genes, whereas three were altered in mcd5. The transcript patterns observed in mcd3, mcd4, and mcd5 are consistent with defects in endonucleolytic cleavage. Since the role of endonucleolytic cleavage in atpB 3' maturation has been well characterized, a series of reporter strains containing the ectopically-expressed atpB processing determinant, which consists of an inverted repeat and endonuclease cleavage site (ECS), were used to further evaluate the role of mcd4 in endonucleolytic cleavage as well as the sequences with which it might interact. These experiments suggested that mcd4 suppresses endonucleolytic cleavage involved in atpB 3' maturation, and that it is involved in endonucleolytic cleavages that initiate degradation. MCD4 likely interacts with the inverted repeat, the ECS CCand/or nucleotides 15-39 downstream of the ECS in facilitating this 3' maturation. To further characterize the role of MCD3, MCD4, and MCD5, a series of map-based cloning tools and methods were generated. Using these methods, MCD4 has been isolated to a 1,300 kb region and candidate gene analysis is underway. Taken together, these studies suggest that MCD3, MCD4, and MCD5 may be components of multiprotein complexes responsible for RNA maturation and degradation in Chlamydomonas chloroplasts that are recruited by gene-specific proteins such as MCD1, or RNA sequences and structures such as those found for atpB. title: BEHAVIORAL RESPONSES OF PANAEUS VANNAMEI TO INCREASED RESTING AREAS AS AFFECTED BY STOCKING DENSITY
abstract: An observational study was constructed to determine the behavioral effects on Penaeus vannamei of shelf addition to densely stocked aquaria. Trials were conducted in a recirculating system at the University of Southern Mississippi's Gulf Coast Research Lab in Ocean Springs, Mississippi. Initial studies focused on the addition of multiple stacked-shelf units into six low density (77 shrimp per square meter) rearing tanks. Observing zero shrimp occupancy on the stacked shelving units, two alternate scenarios were constructed. Long, single shelves made of either white corrugated plastic or standard black mesh nylon screen were introduced into tanks. Shrimp reaction to shelves was observed for four stocking densities: 77, 179, 407 and 623 shrimp per square meter. Shrimp density was increased during a five-day period and shrimp behavior was noted as either swimming, on shelf, or on floor in five-minute increments during hour blocks from July 6-9th, 2002. Increased stocking densities positively correlated with an observed increase of shrimp occupancy on single shelf units. Preference for mesh-shelf over solid-shelf units occurred at the highest stocking density of 623 shrimp per square meter.

title: Italian political cinema: Surveying a once glorious genrein times of anguish
abstract: A paper presented in February 2005 to the colloquium. Because in the Entralogos context I will dwell in some detail on the theoretical issues underpinning my interest in literature and culture, in the present pages I shall focus instead on some specific historical aspects of the dialectics between Italian society and Italian cinema. In particular, I shall concentrate on what it has become customary to describe by the term "political cinema," as well as some of its reverberations in a genre not normally associated with it: the "comedy Italian style." The two sections on cinema politico and commedia all?italiana will thus constitute the two main articulations of my argument. However, since I cannot assume a specific familiarity with post-WWII Italy among the interdisciplinary community of my readers, I shall introduce those two mini-chapters by a prologue presenting, in broad strokes, the relevant socio-historical context of the peninsula. At the end, I shall return to considerations of a more general cultural import about the challenges of the times in which we live. Italian Studies Colloquium

title: Backscattering anisotropy near 180°: an indication of particle size and shape
abstract: By modelling the single scattering of particles in the exact backward direction (180°) and 5° around, the field of view of an instrument measuring backscattering is simulated. Calculations of the scattering Mueller matrix M_{ij} using a development of the extended boundary condition method [1] are made for spheroidal particles with sizes (D in μ), shapes (defined by spheroidal aspect ratio $\frac{s}{t}$) and refractive indices similar to ($m = 1.05 + 0.01i$) marine particles found in the natural environment.
Results show that information about size and shape can be gathered from the intensity patterns of the backscattering for particles within the anomalous diffraction region. Comparison between the polarised scattering intensity patterns ($I_{\parallel}$ and $I_{\perp}$) produced by these non-spheres and their volume-equivalent spheres provides insight into the information available from backscattering polarimetry on the effects of size and shape in light scattering by differently shaped particles.ONR Ocean Optics and Biology

title: Dynamics of Three Coupled Van Der Pol Oscillators With Application to Circadian Rhythms
abstract: In this thesis we study the dynamics of the in-phase mode for a system of three coupled van der Pol oscillators. Two of the oscillators are taken to be identical and coupled indirectly via a third oscillator whose natural frequency may vary. We use the singular perturbation method known as two-variable expansion to obtain a slow-flow, which is then analyzed using the computer algebra system MACSYMA. We find analytical representations for saddle-node and Hopf bifurcation curves in the parameter space and explore the dynamics found in the in-phase phase space.
The motivation for this work comes from the presence of circadian melatonin rhythms in the eyes of Japanese quail. Recent experiments showing the rhythms in the eyes to be tightly coupled and in-phase with each other have strengthened the hypothesis that the eyes are the location of the central pacemaker for Japanese quail. The melatonin rhythm in each eye is modeled as a van der Pol limit-cycle oscillator. Furthermore, the eyes cannot directly communicate to each other, but do so via a connection to an extra-ocular circadian system, here represented by the third oscillator.

title: The off-specular peak and polarisation effects of an undulating underwater surface
abstract: http://www.hydrooptics.spb.ru/onw2005/index.phpPeriodic undulations are used to describe underwater bottom roughness. An expression of the bi-directional reflectance distribution function (BRDF) is given that is dependent on the given roughness metric. Highlights include an off-specular peak and polarisation effects. For an undulating underwater surface, we have shown through geometric optics that reflectance from a rough diffuse surface increases as the viewing direction approaches the backward direction even in the absence of shadowing and/or self-shading (Clavano & Philpot (2003), see also Cox & Munk (1956)). The effects of shadowing and self-shading are equivalent to applying a geometrical attenuation factor to specular reflectance, which is similar to an analysis of morphological effects using triangular waves by Zaneveld & Boss (2003). We show that a reflectance peak displaced away from the specular direction occurs at large angles of incidence (relative to the global normal) as the surface gets rougher (part of work in Clavano & Philpot (2004)). Similar results have been shown for oil films on ocean surfaces using Monte Carlo methods by Otremba & Piskozub (2004) and Otremba (2004). As a general result, an expression of the full bi-directional reflectance distribution function (BRDF) is given. While geometrical effects play a significant role in the reflectance distribution, we consider polarisation effects (as in Mullamaa (1962, 1964)) to gain more insight into real-world reflectances and compare with empirical distributions described by Cox & Munk (1956).Cornell University Graduate School

title: Reflections and the focusing effect from an ideal three-dimensional rough surface
abstract: An analytical expression for higher-order reflectances from a shallow-water homogeneous ocean bottom modeled as an egg-carton surface is presented. Roughness of this ideal surface is expressed as the amplitude-to-length ratio of its basic sinusoidal function. Any real surface that can be approximated by an egg-carton function will effectively have a comparable roughness metric. Incidence and reflection directions are considered in full azimuthal variation. The detector is located just below the water surface so that only in-water reflections are considered and there are no air-water transmission effects. Furthermore, this setup allows for an understanding of reflections that occur in media with any index of refraction or absorption coefficient. Fixing the detector footprint but adjusting its field-of-view enables the observation of the same bottom surface area as the depth varies while keeping the roughness and the number of waveforms viewed constant.
First-order reflectance decreases as the roughness increases, as was shown in the two-dimensional case. This is true as the roughness varies, regardless of the bottom reference level chosen. Focusing effects are expected from (but are not limited to) second-order reflectance and are due to parts of the bottom whose angles maximize both incoming light and the reflections toward the detector. Along a plane about the vertical axis, the roughness ratio for a fixed-length waveform that returns the highest reflectance can be found. In three dimensions, this phenomenon is complicated by reflections from all hemispherical directions. Shadowing and obscuration behave similarly as in the two-dimensional case although shadowed areas will have an

increased potential to reflect light from other directions (than the plane defined by the source incidence and the vertical directions). This is expected to cause higher order reflections to increase as the roughness increases. Cornell University Graduate School ONR Ocean Optics and Biology

title: Quality in Bibliographic Control
abstract: The Quality of cataloging is an issue that has engendered much discussion over decades of bibliographic control. Juxtaposed against the standard of full, accurate, and timely bibliographic records is the pressure to produce reliable access in a cost-effective manner. In reviewing the definition of quality at the Library of Congress (LC), the relationship of quality cataloging to copy cataloging, minimal level cataloging, the core bibliographic record, and outsourcing, the author concludes that the definition of quality is dynamic and dependent on the values and needs of catalog users.

title: A COGNITIVE PRIMING APPROACH TO THE STUDY OF ADULT ATTACHMENT
abstract: In recent years, no single area of research in personality/social psychology has attracted more interest than the application of attachment theory to the study of adult romantic relationships. This research has focused almost exclusively on individual differences. To date the field lacks a set of objective standards for determining whether participants in attachment research are, in fact, attached. The current study explores the validity of a self-report measure of attachment (i.e., the WHOTO). This self-report measure identifies the figures toward whom individuals direct the four behaviors that define attachment (i.e., proximity maintenance, safe haven, separation distress and secure base). Using a lexical decision task, I recorded the relative speed with which participants recognize the names of reported significant people following a subliminally-presented threat or neutral word prime. I hypothesized that participants who direct all four attachment behaviors toward one figure will react faster to the significant person's name after a threat word prime compared with a neutral one. A total of 127 participants took part in Study 1, in which the prime was an attachment-related threat (i.e., the word "separation"), and 69 participants took part in Study 2, in which the prime was an attachment-unrelated threat (i.e., participant's idiosyncratic fear). I found that participants who direct all attachment behaviors toward the significant person were faster to recognize the figure's name after a threatening word compared with a neutral one, whereas the opposite was true for participants who do not direct all attachment behaviors toward the significant person. These results contribute to further validation of the WHOTO as a measure of normative attachment that can be used to distinguish between

relationships that have some attachment components and relationships that qualify as full-blown attachments. In addition, participants who direct all attachment behaviors toward their romantic partner reacted faster to his/her name after a threatening word compared with a neutral one only if they were cohabiting. This finding highlights the importance of physical proximity in adult romantic attachment.

title: A High-Precision Measurement of the Di-Electron Widths of the Upsilon(1S), Upsilon(2S), and Upsilon(3S) Mesons at CLEO-III
abstract: The di-electron width of an Upsilon meson is the decay rate of the Upsilon into an electron-positron pair, expressed in units of energy. We measure the di-electron width of the Upsilon(1S) meson to be 1.252 +- 0.004 +- 0.019 keV (the first uncertainty is statistical and the second is systematic), the di-electron width of the Upsilon(2S) to be 0.581 +- 0.004 +- 0.009 keV and that of the Upsilon(3S) to be 0.413 +- 0.004 +- 0.006 keV. We determine these values with better than 2% precision by integrating the Upsilon production cross-section from electron-positron collisions over their collision energy. Our incident electrons and positrons were accelerated and collided in the Cornell Electron Storage Ring, and the Upsilon decay products were observed by the CLEO-III detector. The di-electron widths probe the wavefunctions of the Strongly-interacting bottom quarks that constitute the three Upsilon mesons, information which is especially interesting to check high-precision Lattice QCD calculations of the nuclear Strong force. This work was supported by the A.P. Sloan Foundation, the National Science Foundation, and the U.S. Department of Energy.

title: When New Things Were Old
abstract: How does a novel artifact become a mainstream device? Three case studies on the transition from muscle to motor power indicate that the transfer of practices from old to new technologies facilitates technological change and diffusion. Case One examines the horseless carriage industry in the United States during the first decade of the twentieth century. To understand manufacturers' efforts to generate consumer demand, this study reflects upon printed advertisements, manuals, and social commentaries prior to mass production of the automobile.

Case Two examines motorization in a highly resistant environment--the post-WWI US Cavalry. Cavalry service and drill regulations manuals serve as the basis for understanding the centrality of the horse to the cavalry's fighting strategy and the cavalryman's identity as a combatant. The Cavalry Journal, an internal military publication, provides evidence of the role military horse culture played in impeding--and eventually facilitating--motorization. Mechanisms employed to maintain equine traditions gave birth to the jeep. The use of the jeep under battlefield conditions replicated cavalry style maneuvers and fighting principles. Similar to the cavalryman and his warhorse, the American GI and his jeep became inseparable.

Case Three addresses the domestication of the jeep in the Philippines, where successful motorization was again attributable to horse culture. Photographs, paintings, and observations from travelers, including the Philippine Commission Report of 1900-1901, and contemporary accounts and reflections of local scholars supplemented with phone interviews conducted in the Ilocano and Tagalog (Filipino) dialects prove useful sources for understanding the influence of horse legacy on motorization.

Results show that in each case the shift from muscle to motor power required a forced likeness between the motorcar and the horse. Automotive ubiquity did not occur simply because cars became much cleaner, more

efficient, and more affordable than horses. In each case, the motorcar relied upon society's long-standing working relationship with the horse in order to be understood and accepted. When cars began to be perceived as functioning like horses, rapid diffusion ensued as socioeconomic and cultural practices built around the horse were transferred to the motorcar.

title: STEROL REGULATION OF HEPATIC LIPASE. A NOVEL ROLE FOR STEROL REGULATORY ELEMENT BINDING PROTEIN IN CHOLESTEROL HOMEOSTASIS
abstract: Hepatic lipase (HL) plays a critical role in the modulation of plasma lipoprotein concentrations and specifically the concentrations of high density lipoproteins and small low density lipoproteins. HL is likely to play a role in cellular cholesterol homeostasis. Despite numerous studies aimed at characterizing HL regulation, the role of cholesterol in controlling HL expression and/or activity levels remains unclear. In Fu5AH and McA-RH7777 rat hepatoma cells, cholesterol treatment resulted in a marked decrease in secreted rat HL (rHL) mass. Similarly, the acyl-CoA:cholesterol acyltransferase inhibitor 58-035 decreased rHL secretion, suggesting that unesterified cholesterol mediated the downregulation. Cholesterol alone or in combination with 25-hydroxy-cholesterol, or 58-035 decreased rHL mRNA levels without affecting mRNA degradation rate. Sterol Regulatory Element Binding Proteins (SREBPs) are the major transcription factors mediating the feedback regulation of cholesterol levels. Sterol treatments decreased nuclear SREBPs in human HepG2 cells without affecting the activity of a -1480/+14 human HL (hHL) promoter luciferase construct in rat or human cells. In HepG2 cells, statin (compactin) treatment or over-expression of nuclear SREBP1a (nSREBP1a) decreased the activity of a -117/+14 hHL promoter construct and HL mRNA levels. Forced expression of nSREBP1a reversed the Upstream Stimulatory Factor 1 (USF1)-mediated activation of hHL promoter constructs. Gel-shift and supershift assays identified binding sites for Hepatocyte Nuclear Factor 1 (HNF1), HNF4 and USF1 within the hHL promoter at -70/-48, -252/-218, and -317/-298 respectively. Binding of these factors was diminished using nuclear extracts from sterol or compactin treated cells. No direct binding of nSREBP to the hHL promoter was identified. SREBP1a bound to USF1 in co-immunoprecipitation experiments, suggesting inhibition of HL transcription by cholesterol or compactin may occur through SREBP1 interaction with USF1 or its co-activators. In rat cells, cholesterol or 58-035 decreased rHL protein synthesis while protein turnover was unchanged. In vitro translation assays demonstrated a decrease in HL translation efficiency in sterol-treated cytoplasmic extracts. These experiments provide evidence for a novel aspect of the function of SREBPs in the crosstalk between cholesterol and fatty acid/triglyceride metabolism.

title: Advances in Scholarly Communication: Institutional Repositories
abstract: How do you make your research available to the widest possible public? How do you and others in your field measure its influence? How do you preserve it for the future? This semester Mann library is offering a series of presentations that deal with these pressing questions particularly for faculty, staff and graduate students.
With the rapid changes in scholarly communication in the digital age and the call for more open and economically sustainable methods of publication, institutional repositories--digital libraries where faculty and graduate students can deposit online copies of their publications, theses and data--have arisen as viable avenues for disseminating and preserving research. In this presentation, Marcy Rosenkrantz, Director of Cornell University Library Systems, will demonstrate DSpace, Cornell's institutional repository, and explain how it can help make scholarly work more accessible to a greater number of people, increase its citation, and store it for the future. title: Watershed modeling of the Cannonsville Basin using SWAT2000: Model
abstract: This report describes the calibration and validation of a spatially distributed watershed model of the Cannonsville Reservoir Basin. The Soil and Water Assessment Tool 2000 (SWAT2000) was selected as the watershed model. A set of SWAT2000 inputs representative of the watershed conditions was derived from a wide array of data sources. Important methods were developed for converting available information to SWAT2000 inputs for groundwater soluble phosphorus concentrations, initial soil phosphorus levels and daily manure application. The Cannonsville Reservoir is a New York City water supply reservoir located in upstate New York that has historically experienced water quality problems associated with phosphorus loading. As a result, the watershed has been subjected to multiple water quality regulations including a recent Total Maximum Daily Load (TMDL) assessment for phosphorus. The reservoir watershed covers an 1178 km2 area and is dominated by agriculture, particularly dairy farming. The SWAT2000 model of the Cannonsville Reservoir Watershed is a valuable tool that can be used to help identify and evaluate quantitatively the long-term effects of various phosphorus management options for mitigating loading to the reservoir. SWAT2000 was developed by the Agricultural Research Service of the United States Department of Agriculture. SWAT2000 simulates through time the daily soil water balance, growth of plants, build-up and subsequent transport of soil nutrients to surface waters in response to agricultural management practices. The simulated mass balance of soil phosphorus in SWAT2000 is an important aspect of any watershed model that is to be used for regulatory purposes. The authors modified a few of the SWAT model equations to better simulate measured flows, sediment loading and phosphorus loading during the winter. The model was calibrated and validated for the prediction of dissolved and particulate phosphorus transport, and therefore also flow and sediment transport, against a large set of monitoring data. Extensive continuous flow and water quality data over a 10-year period from multiple locations within the basin were used for model calibration and validation. Sensitive model parameters were adjusted within their feasible ranges during calibration to minimize model prediction errors for daily flows and monthly sediment and phosphorus loading. At the main flow gauging station in the basin (Walton), draining almost 80% of the watershed, daily calibration resulted in model predictions of average flow within 1.0% of the measured average flow while the daily Nash-Sutcliffe (NS) measure was 0.79. Daily validation results at Walton showed the model predicted average flow within 4.5% of the measured average flow with a NS of 0.78. At the main water quality gauging station in the basin (Beerston), just downstream of Walton, the calibration results showed the model predicted the average monthly sediment and total phosphorus loading within 3% and 6% of their respective measured average monthly loadings. The monthly calibration NS values at Beerston for sediment and total phosphorus loading were 0.66 and 0.68, respectively. Validation results at Beerston showed the model predicted the average monthly sediment and total phosphorus loading within 27% and 9% of their respective measured average monthly loadings. The monthly validation NS values at Beerston for sediment and total phosphorus loading were 0.51 and 0.61, respectively. The largest errors in model predictions for phosphorus and sediment loading were always associated with peak flow prediction errors. Model predictions were also shown to qualitatively replicate bi-weekly sampling of total phosphorus concentrations taken from 10 different locations across

the watershed. Model simulation results over the calibration and validation period (1990-2000) highlighted a number of useful findings. The model predicted that 68% of the total phosphorus loading to surface waters in the watershed originates from active agricultural lands. Corn land use was simulated as the major source of agricultural phosphorus loading even though it covered only 1.2% of the watershed area. Areas North and East of the Town of Delhi tended to have the largest rates of phosphorus loading per unit area. Areas immediately surrounding the Cannonsville Reservoir that are not monitored were simulated to have substantially lower non-point source phosphorus (NPS) unit area loading rates than the monitored portion of the watershed.

title: Franz Reuleaux: Contributions to 19th C. Kinematics and Theory of
abstract: This review surveys late 19th century kinematics and the theory of machines as seen through the contributions of the German engineering scientist, Franz Reuleaux (1829-1905), often called the "father of kinematics". Extremely famous in his time and one of the first honorary members of ASME, Reuleaux was largely forgotten in much of modern mechanics literature in English until the recent rediscovery of some of his work. In addition to his contributions to kinematics, we review Reuleaux's ideas about design synthesis, optimization and aesthetics in design, engineering education as well as his early contributions to biomechanics. A unique aspect of this review has been the use of Reuleaux's kinematic models at Cornell University and in the Deutsches Museum as a tool to rediscover lost engineering and kinematic knowledge of 19th century history of machine.

title: How it was to study and to teach mathematics in Cornell at the end of
abstract: Cornell University's Kroch Library Rare Book and Manuscript Division has a collection called "Department of Mathematics records 1877-1976". It was used already as case studies of the emergence of mathematical research at Cornell University in several publications; but I will talk about my experience going through these records and trying to imagine what mathematics students had learned before entering Cornell University (looking at entrance exams they were given). The earlier publications reported that mathematics entrance requirements to Cornell "were minimal by today's standards" but I found that this was not the case. Many of the students taking the entrance exams were engineering students. At that time the Reuleaux kinematic models collection was used to bring mathematical ideas into engineering curriculum. Preliminary report partially supported by National Science Foundation's National Science, Technology, Engineering, and Mathematics Education Digital Library (NSDL) Program under grant DUE-0226238. (Based on a talk given at AMS- MAA Joint Conference Special Session in History of Mathematics, January 18, 2003, Baltimore.)

title: Experiencing Meanings in Geometry
abstract: It is deep experience of meanings in geometry (and indeed in all of mathematics and well as art and engineering) that we believe deserve to be called aesthetic experiences. We believe that mathematics is

a natural and deep part of human experience and that experiences of meaning in mathematics should be accessible to everyone. Much of mathematics is not accessible through formal approaches except to those with specialized learning. However, through the use of non-formal experience and geometric imagery, many levels of meaning in mathematics can be opened up in a way that most people can experience and find intellectually challenging and stimulating. Many formal aspects of mathematics have now been mechanized and this mechanization is widely available on personal computers or even handheld calculators, but the experience of meaning in mathematics is still a human enterprise. Experiencing meanings is vital for anyone who wishes to understand mathematics, or anyone wishing to understand something in their experience through the vehicle of mathematics. We observe in ourselves and in our students that these are, at their core, aesthetic experiences. In this paper we will tell some stories of our experience of meanings in geometry and art. David's story starts with art and ends with geometry, while Daina's story starts with geometry and ends with art. However we both share the bulk in the middle, including experiences of non-Euclidean geometries and kinematics models.

title: 3D-Printing the History of Mechanisms
abstract: Physical models of machines have played an important role in the history of engineering for teaching, analyzing, and exploring mechanical concepts. Many of these models have been replaced today by computational representations, but new rapid-prototyping technology allows reintroduction of physical models as an intuitive way to demonstrate mechanical concepts. This paper reports on the use of computer-aided modeling tools and rapid prototyping technology to document, preserve, and reproduce in three dimensions, historic machines and mechanisms. We have reproduced several pre-assembled, fully-functional historic mechanisms such as early straight line mechanisms, ratchets, pumps, and clock escapements, including various kinematic components such as links, joints, gears, worms, nuts, bolts, and springs. The historic mechanisms come from the Cornell Collection of Reuleaux Kinematic Models as well as models based on the work of Leonardo da Vinci. The models are available as part of a new online museum of mechanism, which allows visitors not only to read descriptions and view pictures and videos, but now also download, 3D-print and interact with their own physical replicas. Our aim in this paper is to demonstrate the ability of this technology to reproduce accurate historical kinematic models and machines as a tool for both artifact conservancy as well as for teaching, and to demonstrate this for a wide range of mechanism types. We expect that this new form of ?physical? preservation will become prevalent in future archives. We describe the background and history of the collection as well as aspects of modeling and printing such functional replicas.

title: How to Use History to Clarify Common Confusions in Geometry
abstract: We have found that students and even mathematicians are often confused about the history of geometry. Many expository descriptions of geometry (especially non-Euclidean geometry) contain confusing and sometimes-incorrect statements. Therefore, we found it very important to give some historical perspective of the development of geometry, clearing up many common misconceptions. In this paper we use history to clarify the following questions, which often have confusing or misleading (or incorrect) answers: 1. What is the first non-Euclidean geometry? 2. Does Euclid's parallel postulate distinguish the non-Euclidean geometries from Euclidean geometry? 3. Is there a potentially infinite surface in 3-space whose intrinsic

geometry is hyperbolic? 4. In what sense are the Models of Hyperbolic Geometry 'models'? 5. What does 'straight' mean in geometry? How can we draw a straight line? We noticed that most confusions related to the above questions come from not recognizing certain strands in the history of geometry. The main aspects of geometry today emerged from four strands of early human activity that seem to have occurred in most cultures: art/patterns, building structures, motion in machines, and navigation/stargazing. These strands developed more or less independently into varying studies and practices that eventually from the 19th century on were woven into what we now call geometry. In this paper we describe how these strands can be used to clarify issues surrounding these questions.

title: Historical Mechanisms for Drawing Curves
abstract: Mechanical devices such as linkages for drawing curves are known already from Ancient Greece. Later linkages found use in different mechanical devices and machines like we can see it in 13th century drawings by Honnecourt or in 16th century machine drawings by Agricola. In 17th century Descartes accepted only those curves that had a mechanical device to draw them. Mechanical curve drawing devices later became incorporated into different machine design. In this paper examples from Reuleaux kinematic model collection in Cornell University are given and some history of linkages discussed.

title: Research, Libraries, and Fair Use: The Gentlemen's Agreement of 1935
abstract: The Gentlemen's Agreement of 1935 was a voluntary agreement that set guidelines for the limits of acceptable reproduction of copyrighted materials on behalf of scholars. Developed in response to the challenge posed by the easy and inexpensive photographic reproduction of research materials, the Agreement allowed library, archives, museum, or similar institutions to make single photographic copies of a part of a copyrighted work in lieu of loaning the physical item. The copies were not supposed to substitute for the purchase of the original work, and they were intended solely to facilitate research. Liability for misuse was to rest with the individual requesting the copy, and not with the institution making the reproduction.
The Gentlemen's Agreement has long been recognized as one of the most important landmarks in the history of the fair use privilege. In addition, the model of consensual voluntary guidelines agreed to by copyright owners and users, first used with the Gentlemen's Agreement, has become an important technique in clarifying the limits of fair use. Yet little attention has been paid to its genesis or intended audience. Most commentators

view the agreement as primarily a product of long and thoughtful negotiation with librarians, and hence a reflection of their interests. A closer examination of the history of the creation of the Gentlemen's Agreement, however, reveals both the limitations of the common assumptions about the Gentlemen's Agreement and also the limitations of mutually-agreed upon guidelines. The individuals involved with the negotiations from both the scholarly and publishing side were far from representative of their respective areas, and had no authority to negotiate on behalf of their respective spheres. The Agreement itself was largely a product of one afternoon's meeting, with limited discussion and review afterwards.

Furthermore, the Gentlemen's Agreement was intended to serve the needs of research scholars, not librarians. Through an accident of history, however, it was a librarian who conducted the primary negotiations with publishers. As a result, library interests, and not the interests of the research community, came to dominate. Furthermore, the librarian who led the negotiations was different from most of his colleagues in both his professional dependence on the good will of New York publishers and the limited scope of his own library's involvement with library reproduction. As a result, broader issues, such as the educational use of copyrighted material or the extent of acceptable copying under fair use, were consciously excluded from the discussions.

Most of all, the Agreement began the process of subjecting to legal scrutiny private behaviors that up to that point had existed outside of the copyright system. Private actions that had needed no defense in the past came to be viewed as potential infringements of copyright that needed the permission of the copyright owner. Copyright, which up to this time had been a system for controlling publication and widespread commercial distribution of material, began to be seen as a system for controlling private reproduction and use of copyrighted material.

Codifying an agreed-upon set of sanctioned behaviors was not without its dangers. In particular, behaviors that were not part of the initial discussions and hence were not officially sanctioned by the Agreement suddenly seemed suspect rather than simply unresolved. The Gentlemen's Agreement thus began to be seen by some as a defacto cap on the extent of acceptable reproduction by librarians and researchers.

In the 1976 Copyright Act, the limited vision of acceptable behavior by librarians acting on behalf of researchers became codified in law in Section 108. In very real ways, researchers, librarians, archivists, and museum specialists still live with the consequences of the process that led to the development of the Gentlemen's Agreement.

title: ORCHARD PRODUCTIVITY AND APPLE FRUIT QUALITY OF ORGANIC, CONVENTIONAL, AND INTEGRATED FARM MANAGEMENT SYSTEMS
abstract: A thesis submitted in partial fulfillment of the requirements for the degree of MASTER OF SCIENCE WASHINGTON STATE UNIVERSITY Department of Horticulture and Landscape Architecture May 2004 The first of two studies undertaken in this thesis analyzed Washington State's organic apple (Malus domestica Borkh.) exports to the European Union (EU) as a case study of the internationalization of the organic marketplace. Washington's organic apple plantings have grown exponentially and as a result price premiums, which traditionally offset the greater costs of production and motivated many Washington growers to certify their apple orchards, have shrunk. At the same time, demand for organic apples in the EU has been outpacing production, thus making EU member states the most important export market for Washington's organic apples. However, an entanglement of regulatory bodies from around the world are involved in the certification of organic products, therefore making international sales very difficult. In this paper, I explored the expansion in the organic marketplace and the adjustments undertaken by growers, marketers, and regulatory agencies.

As part of a long-term comparison of organic, conventional, and integrated apple farm management systems in the Yakima Valley of Washington State, the second study investigated the productivity and fruit quality of ?Gala? apples during the ninth and tenth growing seasons. We found that the technology available for the organic system limited suitable crop load management and, therefore, consistent yields. Pest and weed control and fertility management were more difficult to manage in the organic system, as they all appeared to contribute to its limited productivity. However, organic apples had 6-10 N higher flesh firmness than conventional apples, and 4-7 N higher firmness than integrated apples. Additionally, consumers consistently rated organic apples to be firmer and to have better textural properties. Few consistent results were found for fruit flavor as measured by soluble solids concentration or titratable acidity, and this was also reflected in consumer panels. Total antioxidant activity was 10-15% higher in organic apples than conventional apples and 5-12% higher than integrated apples. The conventional and integrated apple farm management systems were more similar to each other than either was to the organic system throughout this study. Although organic apple production provided more management challenges than conventional systems, the superior quality of organic apples was a notable finding.

title: Keeping Current with Educational Resources
abstract: From the presentation given on May 24, 2006 for Teacher Professional Development Day: “Are you so busy that you don’t have time to find new resources for your classes or keep up with your own professional development? Do you find great resources and then never have the time and ability to find or check them again? Wonder what other teachers are doing and thinking but never have enough time to chat? Have you heard your students talking about Blogger, Bloglines, and del.icio.us and wondered what they are and how you can use them? The latest web tools, like blogs, RSS (Really Simple Syndication), and social bookmarking and other personalized information services, can help. They can bring information to you automatically rather than you having to search for it and can let you know what a community of teachers is reading, thinking and talking about all with minimal effort from you. In a little over two hours, this hands-on workshop will show you how to:
Find and read educational blogs in order to keep up with current educational thinking and resources
Find and subscribe to RSS (Really Simple Syndication) feeds which arrive like your daily newspaper in web-based tool called Bloglines in order to have information and curriculum resources come to you automatically
Use social bookmarking tools (particularly del.icio.us and Scuttledu) in order to save and access the Internet resources you find from anywhere and to find out what other educators are interested in
Create a blog using Blogger software in order to communicate with other teachers and your students

title: A World Without Maps: Post-National, English-Language Literature in the Late Twentieth Century
abstract: A consideration of a constellation of authors working in the fiction marketplace of the late twentieth century. The works of Michael Ondaatje, Jhumpa Lahiri, Aleksandar Hemon, and Anne Michaels are considered. The works are particularly analyzed for the way that they choose to depict the process of crossing borders and refugee life. The authors are grouped together along certain broad critical lines -- particularly along the way that they present the refugee experience with the voice of interiority. Links are then provided to the textual predecessors of these texts and writers, many of whom belong to the Modernist moment: Forster, Conrad, Kipling, and others. Some work is done to establish and define the term, post-national.

title: Diagnosis and management of glaucoma in a horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaves 10-12)."Sunny," a 15-year-old Quarter Horse mare, presented to the Cornell University Hospital for Animals on January 21, 2003 with a chief complaint of corneal edema and discomfort of her left eye. Upon presentation, Sunny was systemically healthy. Her left eye was mildly buphthalmic with an intraocular pressure of 32 mmHg (normal ? 30 mmHg) and it had severe, diffuse corneal edema. Her right eye was normal with the exception of a few keratic precipitates, suggesting a history of recurrent uveitis. Based upon these clinical signs, a diagnosis of left eye glaucoma was made. Medical management was attempted, but it proved to be unsuccessful. An experimental surgical option was pursued. An Ahmed anterior chamber shunt was implanted and portions of the ciliary body epithelium were destroyed with trans-scleral diode laser cyclophotocoagulation. This seminar will focus on the various treatment

options available for glaucoma therapy in horses. Dr. Katherine Cutter

title: Canine thromboembolic disease : a case study and review
abstract: Senior seminar (D.V.M.)--Cornell University, 2003.
Includes bibliographical references (leaves 14-15).An adult castrated male golden retriever presented with signs of acute onset, progressive, peripheral neuromuscular disease. A complete medical work-up revealed massive thrombosis of the caudal aorta, femoral arteries, and right femoral vein, and a diagnosis of ischemic neuromyopathy was made. Underlying disease included hypercoagulability secondary to protein-losing nephropathy. Canine thromboembolic disease, although relatively uncommon, is associated with a wide range of underlying disorders and clinical presentations. Diagnosis and treatment of patients can be challenging, and clinical decisions may be complicated by limited data regarding efficacy of various therapeutic options. An overview of the etiology of canine thromboembolic disease, available diagnostic methods, and various treatment modalities, including thrombolytic therapies, will be presented. title: Canine immune-mediated hemolytic anemia : presentation and treatment
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 11-12). Canine immune mediated hemolytic anemia (IMHA) is an autoimmune disease characterized by the increased destruction of red blood cells by autoantibodies. A type two hypersensitivity reaction, it can be primary or secondary in nature. Most cases are primary (idiopathic) but secondary IMHA can occur with concurrent infection, such as with the blood parasites (Ehrlichia and Babesia) or leptospirosis, with inflammation or immune mediated processes such as systemic lupus erythematosus or with lymphoid malignancies. Viral infection can also predispose an animal to IMHA, in particular parvovirus and distemper. Treatment of IMHA centers on finding the causative agent, in the case of secondary disease, and on immunosuppressive therapy with drugs such as corticosteroids, cyclosporine, azathioprine and cyclophosphamide. The short-term prognosis for dogs with IMHA is guarded due to the multiple complications inherent in the acute stages of the disease. If an animal survives acute disease the long term prognosis is fair. Dogs frequently experience relapse and may become refractory to previous therapies with each relapse. This study centers on the case of Scooter DePew, an English bulldog, who was diagnosed at Cornell University's Hospital for Animals with IMHA in June of 2002.Advisor: Dr. Tristan Weinkle / Clinicians: Dr. Richard Goldstein, Dr. Stephen Barr, Dr. Tristan Weinkle

title: Shaker syndrome in a cat
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf (11)).A 17-month old, castrated male, domestic shorthaired cat, presented for a 6-week history of whole body, generalized tremors, which had developed suddenly and were non-progressive. He had no history of exposure

to toxins. His tremors were most pronounced in his head and worsened when he was stressed or excited. He had jerky, erratic eye movements, which were thought to be another manifestation of his tremor disorder. The cat's neuroanatomic localization was a diffuse central nervous system disorder. CBC and Chemistry panel results ruled out extraneural causes for the tremors. Serologic tests for infectious diseases were negative. No significant abnormalities were appreciated on CT scan or CSF analysis. Muscle and nerve biopsies were normal. Because diagnostic tests and history failed to reveal an inflammatory, infectious, or toxic cause for tremors and because his signs were consistent with a steroid responsive tremor syndrome seen in dogs, he was treated with immunosuppressive doses of prednisone. His condition improved dramatically within a few days and full recovery was reached within 2 weeks. Dr. Scott Schatzberg

title: Bilateral slipped capital femoral epiphyses secondary to physeal dysplasia in a cat
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 10). Slipped capital femoral epiphysis is a well-described phenomenon in humans, characterized by an atraumatic separation of the femoral head from the femoral neck at the capital physis. The syndrome most commonly affects overweight to obese adolescent males. A similar syndrome has been described in cats, pigs, and dogs. In all species, the histopathologic lesions are similar, consisting of irregular clusters of chondrocytes surrounded by abundant chondroid matrix on either side of an unusually wide physis. This lesion in cats has been called physeal dysplasia. The etiology is idiopathic, but is believed to be multifactorial, with genetic, nutritional, endocrine, and other mechanisms involved in the pathogenesis. Slipped capital femoral epiphysis is a recently described entity in veterinary medicine, and should be included in the differential diagnosis for a young cat or dog with an acute or insidious onset of unilateral or bilateral hip lameness or pain with no history of trauma. title: Rinderpest surveillance in eastern African wildlife
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 11-12).Rinderpest is a morbillivirus that affects many arteriodactyls, particularly cattle, Cape buffalo (Syncerus caffer), lesser kudu (Tragelaphus imberbis) and eland (Taurotragus oryx). Designated by the Office Internationals des Epizooties (OIE) as a Class A disease, it has many world trade ramifications. It presently exists in regions of India, the Middle East and Eastern Africa, where there was a wildlife epidemic between 1993 and 1997. The disease is spread by direct or close contact of aerosolized virus, and epitheliotrophic clinical signs are observed. Diagnosis is achieved at necropsy or through use of serological screening tests including ELISA, virus neutralization and immunoflourescence. In the 1990's a wildlife epidemiosurveillance network was established to investigate and control rinderpest in Eastern Africa, including Kenya, Uganda, Tanzania and Ethiopia. Many wildlife species were immobilized for serological sampling. The epidemic zone was determined in Kenya and prevalence of rinderpest in buffalo during the 1993-1997 epidemic was calculated at 95%. A minimum sampling fraction of 2% during an epidemic was determined. This project established a permanent serosurveillance network and results carried many epidemiological implications for rinderpest monitoring and control. Dr. Richard Kock

title: Vascular ring anomaly resulting in esophageal stricture in a cat
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 13-14). Vascular rings are the result of developmental anomalies of which there are six anatomical variations that will result in an esophageal stricture. Of these, by far the most common is a retained right fourth aortic arch and a left sixth ligamentum arteriosum. Vascular rings can effect multiple animals in the same litter with no sex predilection. They are more common in medium to large breed dogs with a much higher incidence in German shepherds, Irish Setters, Great Danes, and Boston Terriers. Vascular ring anomalies are uncommon in cats with about half of the reported cases occurring in Siamese and Persian breeds. Diagnosis of a vascular ring anomaly is based on history, physical examination, clinical signs, radiographs, an esophagram, and esophagoscopy. Treatment consists of stabilization and surgical correction via division of the vascular ring and periesophageal fibrous bands. This can be accomplished with an intercostals thoracotomy or via thoracoscopic surgery. James A. Flanders

title: Equine corneal ulcer with keratomalacia : medical management
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf (10)).”Rodeo” is an 8-year-old thoroughbred stallion that presented to the Emergency service at Cornell for treatment of a melting corneal ulcer. Rodeo had sustained a traumatic injury to the left eye three days prior to presentation. The referring veterinarian had begun treatment with topical neomycin-polymixin-bacitracin ointment and topical tobramycin alternating every two hours throughout the day. Oral flunixin meglumine and topical atropine were given for management of secondary uveitis and no treatments were performed at night. On presentation at Cornell, Rodeo was excited, alert, and responsive. Except for his left eye, physical exam was unremarkable. Rodeo was sedated and the auriculopalpebral and supraorbital nerves were blocked, and a complete ophthalmic exam was performed. His left eye was found to have an axial, deep stromal melting ulcer approximately 2cm in diameter. The most central 4mm was much deeper with only about 1/5 of corneal stromal thickness remaining. Due to insurance concerns medical management was elected. A subpalpebral lavage system was placed to facilitate hourly application of topical medications. Rodeo was treated with several different antibiotics as well as anticollagenases to control the keratomalacia (melting). Atropine was used at varying frequencies to control the secondary uveitis. After much time and dedication the eye healed well with minimal scarring.

title: Pulmonary thromboemboli : a case of acute respiratory distress in a shih tzu : recognition, diagnosis, and treatment options
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 14-15).Pulmonary thromboembolism is an uncommon but likely under-diagnosed condition in small animal medicine owing to both lack of awareness and difficulty in making an antemortum diagnosis (1). Pulmonary thromboembolism (PTE) occurs when a thrombus, thrombi, embolism, or emboli causes occlusion of one or more pulmonary arteries (1). Besides hypoxemia, this occlusion of the perfusion to the lungs can result

in severe pulmonary hypertension, eventually leading to right sided heart failure (cor pulmonale.) Because of this ventilation/perfusion mismatch and secondary right-sided heart failure, patients with pulmonary thromboembolism often present in acute respiratory distress. Pulmonary thromboembolism carries with it a guarded to grave prognosis, despite proper diagnosis, intervention, and treatment. The goal of this report is to use a real case of pulmonary thromboembolism to distinguish pulmonary thromboemboli from other causes of acute respiratory distress; to identify common presenting complaints and associated clinical signs, physical exam findings, and predisposing factors for pulmonary thromboemboli; and to discuss diagnostic and treatment options available. title: Free ranging rhesus monkeys (Macaca mulatta) and herpesvirus B : public health risks in Puerto Rico
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves (10-11)).Two species of introduced non-human primates currently thrive on the island of Puerto Rico: rhesus macaques (Macaca mulatta) and patas monkeys (Erythrocebus patas). While most of the monkeys live in groups in the southwest region of Puerto Rico, recent events have indicated the primates may be dispersing or are being introduced to other areas on the island, including urban areas. Both species are thought to have originated from the La Parguera Primate Facility (LPPF), which was administered by the Caribbean Primate Research Center (CPRC) of the University of Puerto Rico's Medical Science Campus from 1961 until 1982. While both species are a concern as agricultural nuisances and as exotic species competing with indigenous fauna, the rhesus monkey presents a serious public health concern due to the potential for carrying and transmitting herpesvirus B. As macaque populations continue to grow and encounters with humans become more common, risk of transmission of herpesvirus B to humans has become a serious consideration and ongoing challenge for public health officials in Puerto Rico. While this disease has been the focus of attention in primate research and laboratory environments across the United States over the past seventy years, public knowledge of risks involved with interacting with rhesus monkeys is deficient. Puerto Rico faces a formidable challenge, as the majority of their population, including much of the healthcare community, is unaware of zoonotic risks presented by this introduced species. A recent exposure of 25 persons to a seropositive rhesus macaque in Bayamon, Puerto Rico underscores the importance of public education regarding these health risks associated with interactions between humans and non-human primates.

title: Systemic lupus erythematosus in a dog : diagnosis and treatment
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 14-15). The following case report describes the presentation, diagnostic workup, and treatment of a 9-year-old female spayed Lhasa Apso who presented to the Emergency Service at Cornell University Hospital for Animals with a presumptive diagnosis of systemic lupus erythematosus (SLE) from the referring veterinarian. Definitive diagnosis of SLE is often complicated given the many clinical manifestations of the disease. A discussion of the diagnostic procedures, diagnostic criteria, as well as the theoretical pathogenesis of the disease, follows. Canine SLE is the animal model for the more common disorder of human SLE. Therefore, though the disease is not very prevalent in the canine population, it is an area of intense research.Tristan Weinkle, DVM

title: Metabolic bone disease in the green iguana (Iguana iguana) for the general small animal clinician
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 15). Metabolic bone disease (MBD) is a pathologic demineralization of the skeleton occurring in numerous species due to various factors. MBD affects a great number of captive green iguanas (Iguana iguana), most cases are the result of failure of the owner to provide a proper diet and environment. Typically the failure to provide adequate husbandry results in a condition in which a juvenile green iguana experiences skeletal demineralization and develops skeletal deformities. A less common presentation of MBD that is occurring with greater frequency is a condition in which the adult green iguana develops renal dysfunction that leads to loss of calcium homeostasis that results in muscle tetany and skeletal demineralization. Two cases presented to Cornell University's Hospital for Animals exotic animal clinic are discussed that exemplify different presentations, diagnoses, pathophysiology and treatments of MBD in the green iguana. title: Investigation into a suspected outbreak of teratospermia due to pyrethroid poisoning at a bull stud
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 13).The possibility that exposure to bifenthrin induced an outbreak of teratospermia at a bull stud was investigated. Semen evaluation and clinical examination of reproductive organs were performed weekly on hospitalized

sentinel cases and at critical intervals on bulls remaining at stud. During the 13 days following exposure to bifenthrin, semen quality was poor, with significantly decreased progressive motility, high percent of distal midpiece reflexes, and reduced ejaculate volume. However, clinical examination of bulls revealed no gross abnormalities of reproductive organs. Evaluation 26 days following exposure showed overall improvement in semen quality, with progressive motility increased, percent distal midpiece reflexes reduced, and ejaculate volume trending upwards. Clinical examination continued to demonstrate no abnormalities of reproductive organs. Semen quality recovered to levels nearly equivalent to those observed before exposure and was similar when re-evaluated at 64-days postexposure. These data suggest a potential deleterious effect of bifenthrin on epididymal, but not testicular function. Dietrich Volkmann, BVSc, MMedVet (Gyn)

title: Management of acute renal failure in a cat
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 16-17).A 6 year-old, spayed female, domestic shorthair cat was admitted for evaluation of a pathologic fracture of the right calcaneus associated with a soft-tissue mass. The patient became anuric and inappetant 2 days following a right pelvic limb amputation. Complete blood count and serum biochemical analysis revealed anemia, severe azotemia and metabolic acidosis. Acute oliguric renal failure was diagnosed and intravenous fluid and diuretic therapy were initiated. The azotemia, electrolyte imbalances, and acidosis were refractory to 6 days of intensive medical management. The patient was transferred to a facility with hemodialysis. Hemodialysis therapy was successful in reducing the metabolic abnormalities, and the patient was discharged. One month later, the patient presented for evaluation of heart failure and presumptive aortic thromboembolism. The patient died in hospital despite aggressive medical treatment. Current therapies in the management of acute renal failure in the cat will be discussed, including intravenous fluid and diuretic therapy, peritoneal dialysis, hemodialysis, and renal transplantation. title: Evaluation of chronic weight loss in a horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 18-19)."Spencer", an 11 year old Thoroughbred gelding, presented to the Equine Hospital at Cornell University on January 28, 2003 for evaluation of chronic weight loss of 6 months duration. "Spencer" was moved from Colorado to Connecticut in August of 2002, at which time he began to lose weight despite excellent care by his owner. The horse was referred for evaluation of the chronic weight loss, depression, persistent

polycythemia, and an unexplained episode of rhabdomyolysis (CK=14,000). This paper will focus on the differential diagnosis for weight loss in a horse, how each was considered, and sequential diagnostic testing to arrive at the presumptive antemortem diagnosis of diffuse alimentary lymphoma, and the complicating factors including difficulty in distinguishing alimentary lymphoma from diffuse inflammatory bowel disease. Although not definitively proven, a histopathologic diagnosis of inclusion body myositis, and clinical diagnosis of polycythemia were also made in this case. Jerome VanBiervliet, DVM

title: Using rectal temperature measurements in fresh cow monitoring programs and treatment protocols
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 7).Today's dairy industry is marked by decreasing or stagnant profit margins and tight labor markets. Input costs continue to rise faster than the milk price. At the same time cost of living increases and government regulations have forced farm managers to increase the wages and benefits paid to employees and themselves. Payroll is second only to feed cost, in operating expenses on dairies. This puts farm managers under increasing pressure to use their employees more efficiently and effectively. While our ability to manage the nutrition and genetics of cattle has dramatically increased the productivity of dairy cattle, it also causes additional stresses that need to be managed.

title: Malignant histiocytosis in a cat
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 12-13).Tobey Jones, a 13 year-old male castrated Domestic Shorthair cat, presented to the Emergency Service at Cornell University Hospital for Animals for evaluation of dypsnea and acute onset, episodic open-mouth breathing. The cat's history included many months of inappetance, weightloss, and episodic, non-productive coughing. Physical examination revealed generalized poor body condition (body score: II/V), multiple skin nodules, and increased lung sounds. Cytology of multiple skin nodules and of pleural fluid showed a predominance of round cells with abundant cytoplasm. The morphologic of the round cells, combined with a history of pulmonary disease, lead to a cytologic diagnosis of malignant histiocytosis (MH). Malignant histiocytosis (also termed disseminated histiocytic sarcoma) is a type of round cell tumor composed of antigen presenting cells of dendritic cell origin. Histiocytic disease can be broadly classified as either a reactive or neoplastic process, distinguished by clinical behavior, histopathologic features, and immunohistochemical markers. Malignant histiocytosis is an aggressive, systemic, neoplastic condition that is uncommon in the dog, although Bernese Mountain Dogs, Rottweilers, and Retrievers are overrepresented. It is rare in the cat. In both species, MH has a rapidly progressing clinical course and is poorly responsive to chemotherapy. Its prognosis is grave. This paper will focus on the classification of histiocytic disease, and what is known to date about MH in feline patients. Dr. Dennis Bailey, Dr. John Randolph

title: Artificial insemination in a developing country : a tool for better production
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 8).During August and September of 2002, I spent six weeks in Loja, Ecuador working with the Universidad Tecnica Particular de Loja agriculture department on an Expanding Horizons project. The goal of this project was to introduce artificial insemination (AI) to the small farmers of Loja, Ecuador and set up a cooperative group that will continue to use artificial insemination in that area. The project consisted of four 1-week seminars, which served to introduce the farmers to the theory and practice of AI as well as set up the group that will form the cooperative. The participants of the seminar had access to sperm from three bulls from which to choose ten insemination straws. Genex donated the semen for this project with the goal of helping to initiate the use of AI in Loja, Ecuador. The materials and supplies used for this project were purchased with funds from a grant from the Lincoln Ellsworth Foundation as part of an Expanding Horizons project. This paper will talk about artificial insemination and its use as a tool for better production in a developing country, with focus on the work and data collected during my trip to Loja, Ecuador. title: Acute liver failure in a horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf (9))."Rebel," a 13 year old quarter horse gelding, presented to the Large Animal Clinic at Cornell University in mid-June for a four day history of icterus, change in attitude and lethargy. Rebel was kept on a 4 acre pasture with two other horses on which they spent the majority of the day. They were brought in at night and given a small amount of hay and grain to supplement what they ate while out on pasture. One of these horses, a 28 yr old gelding, had what the owners described as an "episode of jaundice" 2-3 months earlier that resolved with treatment with sulfamethadiazines and fluid therapy by the referring DVM. The other horse, Rebel's half brother, JR, had been euthanized by the referring DVM the morning of Rebel's presentation to the LAC. Approximately ten days earlier, JR started acting unusual and wanted to stay inside, specifically in the darkest corner of his stall. A day or two later, he was noticed to be icteric. JR quickly progressed from lethargy and depression, to ataxia, seizuring and head pressing. He was euthanized about one week after the onset of icterus. Abbreviated bloodwork from the referring DVM showed signs of dehydration (elevated hematocrit and total protein), a possible inflammatory process (neutrophilia) and liver damage (elevated gamma-glutamyltransferase). Approximately two days prior to the onset of JR's clinical signs, a large portion of the pasture had been brush hogged. None of these horses had received tetanus antitoxin or other equine serum product in the past 4-6 weeks. Based on the rapid progression of JR's clinical signs and the similarity to Rebel's current clinical signs, his owners decided to bring Rebel to Cornell.

title: Transvenous pacemaker implantation for the treatment of a canine bradyarrhythmia
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 15-16).Sammy, a 12-year-old, male, neutered Beagle presented to Cornell University's Hospital for Animals on October 24, 2001 as a referral for an episode of collapse that occurred the previous day. Upon presentation to Cornell, Sammy was quiet, alert, and responsive, but was very lethargic. Physical examination revealed severe bradycardia with audible S4 heart sounds and a grade III/VI left apical systolic murmur. Jugular pulses were present, and femoral pulses were strong bilaterally. An electrocardiogram (ECG) revealed third degree AV block with an atrial rate of 160 bpm and a ventricular escape rhythm of 20-22 bpm. Thoracic radiographs taken at the referring veterinarian revealed mild cardiomegaly with normal pulmonary vasculature. Echocardiography was performed and showed mild to moderate dilation of all four cardiac chambers. The left ventricle was hyperdynamic with an increased fractional shortening (43%). There was moderate mitral insufficiency during both systole and diastole. Severe thickening and prolapsing of the mitral valve was diagnosed as presumptive valvular endocardiosis. The treatment of choice for complete heart block, whether the animal is symptomatic or not, is transvenous pacemaker implantation. That same afternoon, a transvenous permanent pacemaker was surgically implanted in Sammy. Due to the inherent instability of Sammy's ventricular escape rhythm, it was decided that a temporary pacemaker would be placed prior to the implantation of a permanent pacemaker. The pacemaker used in Sammy's case was a single chamber rate responsive pacemaker with a bipolar lead placed in the endocardium of the right ventricle. Dr. N. Sydney Moise, Dr. Amara Estrada

title: An orf outbreak in a herd of Boer cross goats
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf (13)).A goat herd outbreak of skin lesions characterized by scabby, papillomatous dermatitis on the lips and extending into the buccal cavity was investigated. Initial clinical signs in the first animal affected included acute submandibular edema with swollen mandibular lymph nodes. Necrotic areas were observed on the buccal mucosa. Lesions characteristic of orf developed on the muzzle. Over the next seven days, all but one in the group of 38 doe, doeling and wether goats developed similar lesions. A group of 15 buck kids housed separately was initially unaffected, but two developed mild lesions later. This herd of Boer cross goats had no prior history of orf. Lesions in adult animals were similar in severity and duration to those in the younger animals. Orf virus was found in samples of scab material analyzed using PCR and electron microscopy. All cases resolved spontaneously. Orf is an epitheliotropic parapoxvirus that infects sheep and goats. Virulence factors have been identified through research directed at the immunomodulatory characteristics of the virus. Autogenous or commercial vaccines are available, but are fully virulent virus. Orf is zoonotic to humans, typically causing single target lesions on distal extremities, with rare more serious lymphadenopathies described. Control is directed at strategic vaccination, and limiting infectious material buildup in the environment associated with lambing or kidding. Dr. Mary Smith

title: Clinical aspects of canine multiple melanoma
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 11-12). Multiple myeloma is a neoplasm of well-differentiated B cell lymphocytes (plasma cells) typically originating from the bone marrow. The malignancy is most often associated with the transformation of a single B cell line, which may secrete a homogenous immunoglobulin product (known as paraprotein or M-component). The most common M-components secreted are IgG or IgA. Several clinical presentations may occur in conjunction with multiple myeloma in the dog. These include hyperviscosity syndrome, immunodeficiency, bone disease, hypercalcemia, bleeding diathesis, renal disease, cardiac failure, and variable cytopenias. This report describes a seven year old, female spayed, mixed breed dog with a two month history of intermittent epistaxis, inappetence, and lethargy. A CBC, chemistry panel, and serum and urine electrophoresis were consistent with multiple myeloma. The dog had several clinical signs associated with multiple myeloma, which will be discussed. title: Strangles and its complications in a one year old quarter horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 12). Streptococcus equi subspecies equi infection of horses, commonly known as "strangles", is a highly prevalent bacterial disease that continues to plague the equine population. Although relatively fragile outside of the host, the organism is highly contagious and can be transmitted easily between animals by inhalation or ingestion of aerosolized bacteria. The bacterium, a gram positive, highly encapsulated member of the Lancefield Group C streptococci, primarily causes upper respiratory tract and associated lymph node disease solely in equines, but the organism has the ability to cause pathologic sequelae in other regions of the animal's body. Furthermore, the clinical signs of strangles can greatly increase the risk of infection and colonization by opportunistic pathogens. This report discusses a case of Streptococcus equi infection in a 16 month old Quarter Horse that featured numerous systemic sequelae and coinfection by multiple infectious agents. title: Pleuropneumonia in a Thoroughbred brood mare
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 8-9). Pleuropneumonia is a life threatening disease in the horse that requires prompt and aggressive treatment. This paper will present a case of pleuropneumonia in a Thoroughbred brood mare, which developed severe complications of endotoxemia, laminitis, disseminated intravascular coagulation and thrombophlebitis. Treatment, outcome and pathophysiology are discussed. The etiology of pleuropneumonia involves an inciting stress, contamination and infection of the lung paranchyma with oropharyngeal microorganisms and extension of the infection to the pleural membranes. Stress factors include shipping, strenuous exercise, anesthesia, primary viral infection and immunosuppressive disorders. Significant pleural effusion and diminished respiratory capacity results. Anaerobic infection of the lung and pleura occur approximately 5-7 days after the initial signs of pneumonia. Secondary complications are common. A delay in aggressive treatment and the presence of an anaerobic infection lend to a poor prognosis. Dr. Gillian Perkins, Dr. Rachel Gardner

title: Feline vaccine-associated sarcoma : a case report and current management options
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 10-11).Feline vaccine-associated sarcomas (VASs) are locally aggressive tumors that have presented many challenges to the veterinary profession over the last decade. These tumors are most commonly associated with the administration of killed adjuvanted vaccines, but the etiopathogenesis is yet to be confirmed. Ideal management involves early detection and multimodality treatment, including wide surgical resection, radiation, and chemotherapy. Still, this approach has only achieved modest success. At this point in time, efforts to manage this problem are focused on prevention. This paper presents the case of a 7-year-old spayed female Siamese cat with a recurrent vaccine associated sarcoma. Her presentation is typical of those seen at

referral institutions, and will be used to illustrate the process of diagnosis and considerations for management of the disease. Rodney L. Page, DVM, MS

title: Cytosine arabinoside therapy for meningoencephalitis of unknown etiology in seven dogs
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf 11). Granulomatous meningoencephalitis (GME) is a sporadic, rapidly progressive disease of unknown etiology. Clinical signs can be quite variable and prognosis is dependent upon the morphologic form of GME and severity of the underlying lesion. Definitive diagnosis necessitates histopathological examination of neuronal tissues and this is often impractical antemortem. Granulomatous meningoencephalitis is likely to be overdiagnosed in patients with encephalitis of unknown etiology. As such, we propose the terminology of meningoencephalitis of unknown etiology (MUE) when clinical signs are consistent with GME but CNS tissues are unavailable for histopathologic studies. Although immunosuppression has formed the cornerstone of MUE therapy, corticosteroids typically are ineffective as a sole therapy for long-term disease control. To date, the use of cytosine arabinoside as a therapeutic agent for the treatment of MUE has received little attention in the veterinary literature. Here, we report the use of a cytosine arabinoside-prednisone therapy protocol for the treatment of MUE in 7 dogs. The 7 patients were included based upon history, clinical signs, CT analysis, CSF analysis, and negative diagnostic investigations for infectious encephalitis. The treatment protocol consisted of administering cytosine arabinoside (Cytosar) at a dose of 50 mg/m2 SQ BID q3 weeks for a duration of 4 months, along with a tapering dose of prednisone. The mean survival time for the 7 dogs in this study was 291 days, with 6 of the 7 dogs alive. Six dogs were categorized as in clinical remission and 1 dog died after 101 days. In a retrospective study, dogs with focal GME that were treated with sole corticosteroid therapy had a mean survival time of 41 days (Munana and Luttgen 1998) suggesting that treatment with corticosteroids alone is unsatisfactory. While preliminary in nature, the case series presented in this report suggest a potentially important role for cytosine arabinoside in the treatment of dogs with MUE. Scott Schatzberg, DVM, PhD

title: Renal and nutritional causes of secondary hyperparathyroidism
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaf (10)). Secondary hyperparathyroidism is caused by any condition causing a chronic depression in the serum calcium level. Low serum calcium levels lead to conpensatory overactivity of the parathyroid glands. Renal failure is the most common cause of secondary hyperparathyroidism. Nutritional causes such as inadequate calcium intake/absorption or excess phosphorus intake are the other main cause of secondary hyperparathyroidism. Chronic renal insufficiency leads to decreased phosphate excretion and hyperphosphatemia which directly lowers serum calcium levels by the mass law Ca x P = K. Chronic renal insufficiency also leads to decreased levels of the active form of Vitamin D3 which leads to decreased Ca absorption from the gut and hypocalcemia which stimulates the parathyroid gland. (Robbins) Parathyroid hormone (PTH) activates osteoclasts, thereby mobilizing calcium from bone, increases renal tubular reabsorption of calcium, thereby conserving free calcium, increases urinary phosphate excretion, thereby lowering serum phosphate level, and increases conversion of vitamin D to its active dihydroxy form in the kidneys, thereby augmenting GI calcium absorption. Bone resorptive disease is a significant sequelae to longterm hyperparathyroidism.Dr.

title: Traditional age vs. pediatric spays & neuters in cats : is it worth the wait?
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 12-14). The problem of companion animal overpopulation in the United States is a serious issue wrought with multifaceted barriers standing in the way of complete elimination. This paper will focus on surgical sterilization as one means to control over-population. Recent studies estimate that 3 to 4 million cats are euthanized annually and these numbers do not include those unwanted animals that are left to starve or to die of trauma or exposure. One of the main reasons cited for relinquishment of animals to a humane society (36.4%) was that the animals were from an unwanted litter. Traditionally, shelters across the country have adopted animals out with contracts mandating that new owners spay or neuter their pets. Studies have shown that there is less than 60% compliance with this mandate, despite preadoption screening, prepayment of surgical fees, reduced surgical fees, neuter contracts, and follow up activity by shelter personnel. Even in those households that do comply, it can be estimated that many of those cats may wander outside prior to gonadectomy to make their contribution to the overpopulation problem. Just a single pair of cats may be the progenitors of 174,760 kittens in 7 years even if they and their offspring are not allowed to reproduce at full potential. Dr. Leslie Appel

title: Extrahepatic portosystemic shunt in a cat : clinical presentation, diagnosis, and treatment
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves 8-9). Midnight Louie Gehres, a six year old, male-neutered, domestic short haired cat, presented to the Cornell University Hospital for Animals Small Animal Internal Medicine Service in December 2001 for diagnostic tests to investigate a suspected portosystemic shunt. The cat had a three year history of severe, intermittent urinary tract signs, including recurrent urinary tract infections, cystitis, urinary tract obstructions and

cystic calculi. In the three years prior to presentation, the cat had several cystotomies; stone analyses revealed struvite, calcium oxalate, and ammonium biurate stones. In the three months prior to presentation, the cat had elevated post-prandial bile acids on three separate tests. Pre-prandial levels were variable. Tristan Weinkle, DVM

title: Seronegative myasthenia gravis in a silky terrier
abstract: Senior seminar (D.V.M.)--Cornell University, 2003. Includes bibliographical references (leaves (13-14)). "Bella", a 2-yr FS Silky Terrier, was referred to Cornell University Hospital for Animals on 3/19/02 with a chief complaint of tremors. Bella was acquired from a pet store, and was an indoor dog with no travel history. She had no history of vomiting, diarrhea or sneezing, and Bella was reportedly healthy prior to onset of signs. Since 11/01, Bella stopped voluntarily jumping up onto the owner's bed. In 1/02, Bella may have tumbled down the stairs, perhaps causing, or resulting in, her current clinical signs. In 2/02, Bella started to show signs of decreased appetite, decreased drinking, twitching, tremors, weakness/collapse, and lateral recumbency that was worse in the mornings and seemed to improve through the day. During her episodes of collapse, Bella would try righting herself up, but was too weak to do so. By 3/02, Bella also had epiphora, ptyalism, a weak bark, and a wet cough that was worse in the mornings. Referring complete blood count, chemistry panel, and pre- and post-prandial bile acids were all within normal limits, with creatine kinase levels at the low range of normal. Dr. Scott J. Schatzberg

title: Lobular dissecting hepatitis in a 17 month old cocker spaniel
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 15-16). A 17 month old castrated male Cocker Spaniel was evaluated for inflammatory bowel disease, an undefined hepatopathy and gastrointestinal hemorrhage. Preliminary diagnostic testing revealed changes consistent with liver disease and gastrointestinal disease. An abdominal ultrasound showed multiple acquired portosystemic shunts in the area behind the left kidney and minimal small cystic calculi. Because of the concern for varix formation, an exploratory laparotomy was performed in an attempt to localize the source of gastrointestinal hemorrhage and to obtain liver biopsies for histopathology. The presence of multiple acquired portosystemic shunts was confirmed during surgery, but a clear source of gastrointestinal hemorrhage was not identified. Histopathologic findings were consistent with lobular dissecting hepatitis, a type of idiopathic hepatic fibrosis seen in young dogs. Clinical findings could be attributed to portal hypertension secondary to diffuse hepatic fibrosis. Despite repeated attempts at therapy, gastrointestinal hemorrhage persisted. The dog was humanely euthanized three weeks after discharge. John F. Randolph, D.V.M., A.C.V.I.M., Dr. Tristan Weinkle, D.V.M.

title: Severe hypertrophic osteodystrophy in a great Dane puppy
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 11).

A four month old, intact male Great Dane puppy was examined for progressive lameness, recumbency, fever, anorexia, lethargy, and respiratory distress. Hypertrophic Osteodystrophy was diagnosed based on radiographic findings and clinical signs. An interstitial pattern of unknown etiology was noted on thoracic radiographs, and low grade Disseminated Intravascular Coagulation was presumed based on prolonged coagulation times. Clinical signs, diagnostic testing, pathology, etiology and treatment of HOD are discussed, as well as acute management of systemic inflammatory conditions. Alejandro Aguirre, Carrie Goldkamp

title: Generalized tetanus in a four-month-old bull mastiff puppy
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 15). "Tucker" Gold, a four-month-old intact male Bull Mastiff puppy, presented to the Emergency Service of the Matthew J. Ryan Veterinary Hospital of the University of Pennsylvania on September 2, 2003 with a twenty-four hour history of trismus, risus sardonicus, difficulty standing, trembling, and dysphagia. A diagnosis of tetanus was made based on history and clinical signs. Despite progression to generalized tetanus and complications due to acute upper airway obstruction and pneumonia, Tucker improved with medical treatment and intensive nursing care. A rare and potentially fatal disease, tetanus is caused by the neurotoxin tetanospasmin produced by Clostridium tetani. This paper will discuss the etiology, pathogenesis, diagnosis, treatment and a case presentation of tetanus. Dr. Alexander de Lahunta

title: Health benefits of the human-animal bond
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves (8-11)). Although our relationship with companion animals has been assumed to be beneficial by many, scientific proof is still very necessary. Many in the medical and social services fields continue to view a pet as a frivolous expense. Recent research has linked companion animals to numerous benefits including better cardiovascular health, decreased physician visits and prescription costs, and better medication regime adherence. I feel this information is important to publicize so that we may protect the human-animal bond in times of personal crisis. If service providers accept the importance of the human animal bond, they will be more willing to facilitate its preservation. Dr. Emily Levine

title: A case of male pseudohermaphroditism in a horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 10). A 2-year-old Arabian filly, presented with the chief complaints of stallion like behavior and abnormal external genitalia present since birth. Examination revealed a cresty neck, a glans penis protruding from the clitoral fossa, and moderate mammary gland development. The patient had a blind-ended vestibule with the urethral papilla present on the ventral floor of the cranial vestibule, but no uterus or ovaries. The chromosomal sex of the patient was 64,XX. Blood estrogen and progesterone levels were consistent with a male or a mare in anestrus. An hCG stimulation test indicated that testicular tissue was present, but levels were more

compatible with those of a cryptorchid stallion. The patient underwent laparoscopic gonadectomy, whereby gonads, both grossly and microscopically appearing to be testicles, were removed. The gonads were located at the entrance to the internal inguinal rings. The external genitalia was reconstructed into a more normal mare appearance. Following gonadectomy, the patient's clinical signs resolved. Dr. Beinlich, Dr. Gradil, Dr. Krekler, Dr. Woodie

title: Coughing in a dog secondary to intrapulmonary migrating foreign body
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 12-13). A German shorthaired pointer was presented with a one month history of coughing and a 10-day history of mild lethargy. Physical examination was unremarkable. Hematological abnormalities included normocytic, normochromic, nonregenerative anemia; hyperglobulinemia, hypoalbuminemia, and a stress leukogram. The dog was found to have ingested a wooden kabob stick. The stick was thought to have perforated through the wall of the stomach, liver, and diaphragm, and to have subsequently lodged within the pulmonary parenchyma. Surgical removal of the stick and surrounding lung tissue through thoracotomy and partial lung lobectomies resulted in full clinical recovery. Dr. Michele Steffey

title: Recurrent hemoabdomen in a polo pony
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 11-12). "Nola," a nine year old Thoroughbred mare, presented to the Cornell University Equine and Farm Animal Hospital on March 16, 2003 and September 8, 2003 with a chief complaint of ataxia and weakness, respectively. "Nola" had no other known health problems and competed successfully at professional polo between these presentations. Physical examination at both presentations revealed tachycardia and pale mucous membranes. She had a declining PCV over the first night of both episodes that corrected within two to three days. Neurological examination in March revealed vestibular and general proprioception deficits, with neurological examination in September being normal. Ultrasound examination of the abdomen at both episodes revealed approximately 20 cm of fluid in the abdomen with an echogenicity characteristic of blood. No obvious source of the bleeding could be detected via ultrasound exam. As a definitive diagnosis for the cause of hemoabdomen could not be ascertained, supportive therapy for blood loss was administered. The details of this case and the differential diagnoses for hemoabdomen and for acute onset neurological deficits will be discussed. Dr. Van Biervliet, Dr. Gardner

title: A case of hypoadrenocorticism (Addison's disease) in a dog
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 11). Primary hypoadrenocorticism, or Addison's disease, is an uncommon endocrine disease that is believed to result from immune-mediated destruction of the adrenal cortices. All layers of the adrenal cortex are typically affected, resulting in glucocorticoid, mineralocorticoid, and sex hormone deficiency. The history

and clinical signs are usually vague, nonspecific, and often wax and wane. Clinical pathology often reveals electrolyte abnormalities resulting from the lack of aldosterone. Definitive diagnosis is achieved with the adrenocorticotrophic hormone (ACTH) stimulation test. Therapy involves replacing the deficient mineralocorticoids and glucocorticoids. Addison's disease can be well controlled with medication, and the prognosis for most dogs is good to excellent. In the following case discussion, many of the patient's clinical signs and bloodwork abnormalities were consistent with hypoadrenocorticism; however, other aspects of the clinical presentation made the diagnosis more difficult. title: Clinical management of chylothorax in a dog
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf (8)). A ten-month old male castrated Bull Mastiff presented to the Cornell University Hospital for Animals Emergency Service for evaluation of acute respiratory distress. Physical exam, thoracic radiography and thoracocentesis identified pleural effusion. Chylothorax was diagnosed by cytology, triglyceride levels higher than serum and a cholesterol/triglyceride ratio <1. No underlying cause for increased lymphatic and venous pressure or occlusion of lymphatic and venous drainage was found using thoracic and abdominal ultrasonography, echocardiography, thoracic radiography, heartworm serology, CBC and serum chemistry analysis. Medical management in the form of a low fat diet, thoracocentesis and Rutin was instituted. After two additional emergency presentations following medical management, the owners opted for surgery. Thoracic duct ligation, partial pericardiectomy and omentalization were performed with subsequent decrease in effusion volume and change to inflammatory nature. Diaphragmatic hernia from the omentalization site developed post-surgically and was surgically repaired. The chylous effusion had not recurred five months post surgery. Dr. Laurel Hays

title: Water Resources Systems Planning and Management: An Introduction to Methods, Models and Applications
abstract: Throughout history much of the world has witnessed ever-greater demands for reliable, high-quality and inexpensive water supplies for domestic consumption, agriculture and industry. In recent decades there have also been increasing demands for hydrological regimes that support healthy and diverse ecosystems, provide for water-based recreational activities, reduce if not prevent floods and droughts, and in some cases, provide for the production of hydropower and ensure water levels adequate for ship navigation. Water managers are challenged to meet these multiple and often conflicting demands. At the same time, public stakeholder interest groups have shown an increasing desire to take part in the water resources development and management decision making process. Added to all these management challenges are the uncertainties of natural water supplies and demands due to changes in our climate, changes in people's standards of living, changes in watershed land uses and changes in technology. How can managers develop, or redevelop and restore, and then manage water resources systems - systems ranging from small watersheds to those encompassing large river basins and coastal zones - in a way that meets society's changing objectives and goals? In other words, how can water resources systems become more integrated and sustainable?

title: Laura Goes Burlesque: The Petrarchan Parodies of Francesco Berni
abstract: From the introduction: Surely, the critical aspect of Berni?s work cannot be ignored. As parody of its poetic predecessors, Berni?s poems operate as what Thomas Greene describes as an ?engagement of a subtext in a dialectic of affectionate malice.? As not only parodic, but burlesque, this malice can at certain times be quite scathing. Berni does in fact himself place his poetic style in direct opposition to highly-stylized standard of Petrarchism: ?Io ho un certo stil da muratori,? he claims in a capitolo addressed to Ippolito de?Medici. In this work, Berni reflects on his poetic project, claiming eels as his poetic muse and humor as his purpose. He admits to singing the song of a poor shepherd and says he is destined ?far versi da boschi e da ville,? instead of crafting odes to Achilles. At the same time, however, Berni?s poetry does not necessarily operate as an outright usurper of the Petrarchan poetic tradition. Rather than debunk the reigning poetic dowager and replace her with pure innovation, Berni?s poetry calls for a reexamination of the Petrarchan original and an appreciation for and engagement of its original interpretive complexity. His jocular work re-identifies a linguistic richness in the original Petrarchan poetry, engages this complexity, and by doing so encourages other poetry to do the same. Thus, contrary to Frantz, Berni?s work is in fact as its most fascinating when it utilizes and engages Petrarchan images, not when it deviates from them. Furthermore, that deviation itself is not so much a militant revolution as it is a fundamentalist renewal of faith, causing the reader to return to Petrarch?s original words and appreciate their interpretive potential. title: Examples Decision Support Systems for River Basin Simulation
abstract: The following are programs designed to simulate water development and management policies in river basins. They are generic in that they are designed to be applicable to a wide variety of specific river basin water resource system configurations, institutional conditions, and management issues. Each of these example programs is based on a nodelink network representation of the water resource system being simulated. Some include optimization that replaces a more detailed representation of operating policies. All contain menudriven graphics based interfaces that facilitate user interaction. These programs are appropriate for use in shared vision exercises involving stakeholder involvement in model building and simulations. The brief descriptions below have been taken from the model web pages.

title: WEAP ("Water Evaluation And Planning" system)
abstract: WEAP ("Water Evaluation And Planning" system is a user-friendly software tool that takes an integrated approach to water resources planning. Freshwater management challenges are increasingly

common. Allocation of limited water resources between agricultural, municipal and environmental uses now requires the full integration of supply, demand, water quality and ecological considerations. The Water Evaluation and Planning system, or WEAP, aims to incorporate these issues into a practical yet robust tool for integrated water resources planning. WEAP is developed by the Stockholm Environment Institute's Boston Center at the Tellus Institute. For more information check out the web site: http://www.weap21.org/. Included here is a ZIP file of the WEAP system.

title: Biomechanics of terrestrial locomotion in bats
abstract: This dissertation concerns the way in which bats move on the ground. Chapter one is a literature review on the subject, from an evolutionary perspective, that includes contributions from this thesis.
In chapter two, I test an hypothesis frequently used to explain the poor crawling abilities of bats compared with mammals that do not fly. According to that hypothesis, most bats shuffle awkwardly because their hindlimbs are too long and slender to support their body weights, but vampire bats walk well because their hindlimbs are more robust than those of other bats. I used force plates to test a prediction of the hindlimb-strength hypothesis that the peak hindlimb forces of walking vampire bats should be greater than the forces exerted by the legs of poorly crawling bats. I found that shuffling bats (Pteronotus parnellii) exert larger hindlimb forces than walking vampire bats do (Desmodus rotundus, Diaemus youngi). Additionally, I used a simple engineering model of bone stress to demonstrate that the hindlimbs of vampire bats fall within the range of shapes seen in bats that do not walk well. These results do not support the hindlimb-strength hypothesis.
In chapter three, I describe the running gait of Common Vampire Bats (D. rotundus). At low speeds, these bats use a lateral sequence walking gait, similar to those of other tetrapods, but switch at higher speeds to a bounding gait that is powered by the forelimbs. This gait is unique to vampire bats, and appears to be independently evolved form the running gaits of other tetrapods.
In chapter four, I compare the kinematics of locomotion in Common Vampire Bats to those of another terrestrially adept species, New Zealand short-tailed bats (Mystacina tuberculata). The latter use a lateral sequence walk similar to that of D. rotundus and other tetrapods, but do not perform the bounding run. Using force plates to examine the kinetics of their single kinematic gait, I found that the gait of M. tuberculata is a kinetically run-like, and does not shift from a kinetic walk to kinetic run with increased speed the way the gaits of some other animals do.

title: A HISTORY WORTH SAVING: THE PALACE OF FINE ARTS AND THE INTERPRETATION OF

HISTORY ON A RECONSTRUCTED SITE
abstract: Sherene Baugher; Daniel Krall This thesis examines the legacy of the Palace of Fine Arts in the history of San Francisco. The first section is a social history of the site looking at its origins as a site designed by Bernard Maybeck as one of the many palaces constructed for the Panama-Pacific International Exposition in 1915. Today, the Palace remains the only site from the Exposition standing in its original location. In the over ninety years since the close of the Exposition the Palace has undergone various preservation campaigns. Most notably, the structures of the site were reconstructed in concrete from 1964-1974.
The second part of this work explores the Palace?s present situation including discussion of a current large-scale effort to stabilize the structures and landscape of the site. Finally, this thesis addresses the question of how best to provide for the future of the Palace of Fine Arts determining that the major needs of the Palace can be divided into education, interpretation, and physical preservation, and providing recommendations for how to approach the implementation of solutions for each.

title: Regulation of the immune response to the muscle stage of the parasitic nematode Trichinella spiralis
abstract: The parasitic nematode Trichinella spiralis is a natural pathogen of rodents and humans, exhibits a broad host and geographic range, and has served as a valuable model for the study of mucosal immunity. Little is known, however, of the cellular immune response to the chronic and disseminated stage of the parasite that resides within individual, striated skeletal muscle cells. Despite a potent humoral response to muscle stage parasites, there is limited cellular infiltration of infected muscle. We hypothesized that suppression of inflammation was an active process mediated by T helper type 2 (TH2) responses that are characteristic of helminth infections. To address this hypothesis we conducted in vivo experiments using a synchronous

model of infection that bypassed the intestine and allowed us to examine the immune response specifically to muscle-stage parasites. We utilized transgenic mice, adoptive transfer of specific cell populations, flow cytometry, cytokine analysis, histology and immunohistochemistry to characterize the cellular infiltrate that is recruited to infected muscle, identify molecules that modulate this inflammatory response, and finally, to delineate the mechanisms of effector T cell suppression during infection.

The results presented here show that the inflammatory response to muscle larvae is rich in macrophages and CD4 T cells, peaks in intensity at the completion of parasite maturation, and is rapidly down modulated coincident with a shift to T helper type 2 (TH2)-driven response. Our studies in interleukin-10 deficient mice revealed a critical role for this cytokine in controlling inflammation during parasite development, but showed that it is not required during chronic infection. In the absence of IL-10, antigen-specific interferon-? (IFN-?) production and local synthesis of inducible nitric oxide synthase (iNOS) increased dramatically, while TH2 cytokines were unaffected. Our adoptive transfer studies showed that effector T cells were the critical source of IL-10 and are sufficient to protect mice from myositis. In contrast, we found that naturally-occurring regulatory T cells inhibit TH2 responses but do not influence local inflammation. Finally, we provide evidence that, in the absence of IL-10, the pluripotent cytokine transforming growth factor-? (TGF-?) is critical in limiting myositis and protecting parasites in the muscle.

title: Systems Thinking
abstract: This research set out to clarify the construct of systems thinking and to define it as a conceptual framework apart from systems science, systems theory, systems methods, and other perceived synonyms. Greater clarity in the systems thinking construct will assist any one of the many current implementation efforts in which systems thinking is being applied in both scientific disciplines and practical fields. One case of this is the application of systems thinking in public health. The challenges associated with this effort are generalizeable to any of the other fields in which systems thinking is being applied. The ambiguities of the systems thinking construct are central to the challenges people face in understanding and implementing systems thinking.

This exploratory empirical research used structured conceptualization methodology, which mixes qualitative methods with multivariate statistical methods, to investigate the challenges of implementing systems thinking in an applied context. The analysis shows that: (1) the literature reveals that significant ambiguities exist about what constitutes systems thinking and that practitioners are adopting these ambiguities, (2) the methodological review reveals that there are a disproportionate number of descriptive studies and significantly fewer empirical studies and that there are construct validity problems regarding systems thinking in the few existing empirical designs, (3) the results of statistical tests and descriptive statistics across a range of studies show that the aggregate participant sorts in this study are reliable to a high degree, (4) additional statistical tests show low significance in participant ratings and may indicate that the systems thinking construct is sufficiently vague and that participants had difficulty differentiating between clusters with respect to importance, and (5) 25% of clusters representing 48% of the total statements have to do with learning more about systems thinking through educational initiatives, suggesting that participants are unclear about many aspects of systems thinking.

These findings suggest the need for further development and research on four fronts: theoretical, implementational, empirical, and educational. A theory of systems thinking is offered as a first step in these efforts and as a conceptual framework for educational practice. Future research is required to test this theory of systems thinking.This material is based upon work supported by the National Science Foundation under Grant No. IGERT-0333366

title: From Double Fold to Double Bind
abstract: This article has been published in The Journal of Academic Librarianship, http://www.elsevier.com/locate/jacalibAcademic libraries see digital preservation as part of their fundamental mission to guarantee enduring access to the record of civilization?s accomplishments and discoveries. The nature of digital documents presents unique complications which challenge a library?s ability to assure long-term availability. Publishers view electronic backfiles as economic assets, and libraries do not control the physical object. Agreements between publishers and libraries require reaching an understanding on technical issues, the degree of access to the data held in a digital repository, and on the financial responsibility for preservation. This paper describes some of the efforts underway in the United States to establish standards for repositories and to implement digital archiving for electronic journals.

title: HYDROCHEMICAL MODELING OF DISSOLVED ORGANIC CARBON OF A SMALL, UNDISTURBED, OLD-GROWTH FORESTED WATERSHED IN SOUTHERN CHILE
abstract: A simple, mechanistic hydrochemical model for DOC export was developed and tested for a small, old-growth forested watershed on the Chiloe island in southern Chile. Despite the important roles of DOC in both terrestrial and aquatic ecosystems, there are few tested watershed scale DOC models published to date and, in general, they have had modest success in reproducing observed stream DOC fluxes. The model developed here coupled a simple Boussinesq-type hydrological model of lateral subsurface flows from two soil layers and an Arrhenius-type model for DOC production in soil water. One unique aspect of this model is that DOC production is scaled to account for soil saturation. The streamflows were well simulated (r2=0.86). Simulated stream water DOC concentrations also agreed well with observed values (r2=0.80). Simulated soil water DOC concentrations were generally underestimated for the shallow soil layer and overestimated for the deep layer compared to observed values. Lysimeter sampling errors, lack of agreement between modeled and actual soil layers and the relative position of the lysimeters in the watershed are discussed as the possible causes of these deviations. In general, the model presented here captured the DOC stream water trends in this old-growth forest better than similar models used in other ecosystems. The simple structure of this DOC model may offer a good platform to gradually and accurately increase its intricacy, providing a better understanding of the inherent complexity of the processes regulating the carbon dynamics in forested ecosystems.CONICYT - IDB

title: A case of equine sarcoids
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 11). The following paper summarizes a case of equine sarcoids and describes the complexities of the disease, including the proposed etiology and genetic susceptibility, the diagnosis, and the treatment options. To date, there are no curative therapies for sarcoids. In addition to presenting the various existing immunomodulating

treatments, I will discuss the novel use of an autologous heat shock protein peptide vaccine in the continuing battle against equine sarcoids. Dr. Flaminio, Dr. Woodie

title: Malignant catarrhal fever in a Holstein heifer
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves (17-18)). A 20-month-old, red and white Holstein heifer, 6-7 months pregnant, presented to Cornell University's Farm Animal Hospital in September 2003 with the chief complaints of acute onset of recumbency, blindness, anorexia, and weight loss. One week prior to presentation, the heifer became anorexic, separated herself from her herdmates and developed bilateral corneal opacity with blindness. The heifer was from a local herd and kept on a 20-acre pasture with 9 other animals. In the same group, 2 heifers had died 2-3 weeks prior to disease in the heifer. In June of 2003, two spring lambs (age:3-6 months) had been brought onto the farm. The lambs shared a barn with the heifers, but were fenced separately from them by a distance of 3 feet. Diagnostic test results for BVD and IBR, performed by the farm veterinarian, were negative. The farm veterinarian made a tentative diagnosis of Malignant Catarrhal Fever (MCF), based upon clinical signs and a history of contact with sheep. The heifer was referred to Cornell for antemortem testing and necropsy. MCF PCR and MCF CIELISA yielded positive results on antemortem blood. Gross necropsy revealed lesions consistent with MCF, including erosions and ulcerations of the GI tract, bilateral corneal edema, and coronitis. Histopathological lesions revealed a severe diffuse lymphocytic vasculitis and severe lymphocytic keratoconjunctivitis , supportive of MCF. Malignant catarrhal fever is a generalized viral disease of ruminants. It is caused by members of an expanding group of Rhandinoviruses in the Gammaherpesvirinae subfamily. These highly cell associated, lymphotrophic viruses exist in nature as inapparent infections in well-adapted ruminants that serve as reservoir hosts. Transmission of the virus from a reservoir host to a clinically-susceptible species results in a disease that is characterized by high fever, profuse nasal discharge, corneal opacity, ophthalmia, generalized lymphadenopathy, leukopenia, and severe inflammation of the conjunctival, oral, and nasal mucosas. CNS signs, diarrhea, skin lesions, and nonsuppurative arthritis can also be seen. Diagnosis of MCF in a clinically-susceptible species is based upon clinical signs, history of contact with a reservoir host, necropsy with histopathology, and PCR. With the expanding amount of new information, the traditional picture of MCF as a highly fatal, sporadic condition associated with lambing season is becoming less accurate. Clinicians should be aware that MCF can manifest acutely or become latent with recrudescence. While most cattle with clinical MCF die, others may partially or completely recover. Jerome VanBiervliet

title: Pseudohypoadrenocorticism to myelinolysis in 5 days
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 13). Rapid correction of profound hyponatremia in a dog may have led to delayed neurological dysfunction five days later. The initial electrolyte abnormalities were due to Trichuris vulpis gastrointestinal parasitism. A presumptive diagnosis of myelinolysis was made based on the rapid correction of the hyponatremia and the clinical signs. Myelinolysis is a demyelinating brain disease caused by a rapid increase in plasma osmolality. Most naturally occurring cases of myelinolysis reported in the literature have been following rapid correction of hyponatremia due to Trichuris vulpis. The dog recovered, but still has some permanent neurological dysfunction. By following guidelines for proper correction of hyponatremia and prudent monitoring of plasma

electrolytes, myelinolysis, an iatrogenic disease, can be prevented. Richard Goldstein, Tristan Weinkle

title: Think Globally, Act Locally: Electronic Resources and Collection Development
abstract: Despite numerous cooperative collection development endeavors, the building of library collections has remained a highly individual and local practice. The physicality of bound volumes has posed a distinct limitation on our ability to share collections, although libraries have made huge strides in recent years. Electronic resources and the ability to digitize our physical holdings offer the potential to redirect our investments in collection building to the creation of a global network that would serve an international community of scholars. By facilitating the creation of disciplinary-based portals to knowledge resources, librarians can channel their efforts to the benefit of many without sacrificing the quality of local relationships. To accomplish this, libraries need to develop collectively built and managed web sites that supplant the need for autonomous, selector-created ?webliographies? and that greatly expand the number of sources that can be identified and described. Selectors, freed of the individual responsibility to shoulder the increasingly heavy, and ultimately unsustainable load of tracking a proliferation of resources in a variety of formats and states of publication, can turn their attention to the capture of more elusive, but important, material; to more detailed evaluation of the use of information resources; toward improvements in the user interface of portals; or toward the transformation of scholarly communication, with the discipline-based portal serving as a magnet for attracting new forms of scholarly thought and research.

title: Economic Analysis of the Interrelationships Among Off-farm Work, Participation in the Conservation Reserve Program, and Farm Productivity of Farm Households in the United States
abstract: Richard N. Boisvert; Gregory L. Poe; David R. JustTo better understand the interaction between the farm business and the farm household, this study identifies those factors that explain participation in two major sources of non-production income of farm households: off-farm employment by the operator and the spouse and the Conservation Reserve Program (CRP). In addition, we investigate the effects of these decisions on farm efficiency and productivity. Since there is always trade-offs between computational demands and model generalization, it is difficult to develop an empirical model that accommodates all of the interrelationships among these decisions. In this study, three specific econometric models are estimated to test if these decisions are made jointly, sequentially or independently by the farm household. Although the focus of each model differs, our empirical findings are quite robust across models. Our results show that CRP participation depends generally on some characteristics of the farm, the farm operator, land quality, and the circumstances in the local economy. It appears that CRP acres response positively to CRP price but it decreases with the increase of low land quality. Environmental factors also play a role of CRP participation. The farm household located in areas where the EBI scores for land currently enrolled are high is more likely to participate in CRP. Our empirical findings also support the reduction in the likelihood of CRP participation due to the increase in decoupled payments. Similar evidence is found for the decision of the farm household to engage in off-farm work. Older farmers or those who have fewer years in farming are more likely to work off the farm. In addition, the operator?s education has a positive effect on the probability of participation in off-farm work.

Another unique finding of this study is the qualification of the impact on farm productivity of CRP

participation and the off-farm work decision of the farm operator. It appears that participation in CRP lowers the technical efficiency and productivity, but participation in off-farm work increases technical efficiency and productivity. These results may imply that efficiency is more adversely affected when land is withdrawn from production without also withdrawn labor. However, the reverse is not true. title: THREE-DIMENSIONAL CULTURE OF FETAL LIVER CELLS
abstract: This thesis explored the influence of culture environment on proliferation and hepatic differentiation of fetal liver cells. Specifically, signals provided by soluble factors and culture substrates were examined. Comparison of a variety of culture medium conditions suggested that hepatocyte growth factor (HGF) is required throughout the culture period to induce the differentiation of liver stem cells into hepatic precursors, and to ensure the continual proliferation of stem cells and their progeny. On the other hand, timing of the addition of maturation-inducing factors such as oncostatin M (OSM) determines the kinetics of cell maturation. In the presence of HGF, adding OSM from the beginning results in concurrent growth and differentiation. In addition, the constant presence of protective agents such as ascorbic acid helps to enhance cell survival, leading to improved cell expansion and hepatocyte functions. Based on these findings, a modified culture medium was developed to achieve both optimal growth and differentiation. Cell expansion in this medium was about 2 fold of that under other tested conditions, whereas the specific albumin secretion rate was 2 - 3 times of the maximal values obtained with other conditions. Subsequently, characterization of fetal liver cells cultured on a variety of three-dimensional (3D) scaffolds, including decellularized liver matrices, collagen scaffolds, and poly(lactic-co-glycolic acid) (PLGA) scaffolds, showed that the cellular responses to soluble signals are modulated by culture substrates. Experiments using scaffolds prepared from blends of PLGA(50:50) and polycaprolactone (PCL) further suggested that cell expansion requires rigid and porous scaffolds, whereas differentiation is enhanced on more pliable substrates. Together, these results demonstrated that the in vitro behavior of fetal liver cells is regulated by both the soluble and physical cues present in their microenvironment. Furthermore, cell growth and differentiation are influenced not only by the regulatory factors that are present, but also by the timing of their addition. These findings would help to develop a culture system that employs dynamic integration of biochemical and substrate-related signals to control the growth and differentiation kinetics of fetal liver cells. They may also provide a foundation for developing technologies for applications of other liver stem cells and progenitors.

title: Canine diffuse neuromuscular disease : a case of acute polyradiculoneuritis
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 13). Acute, severe, diffuse neuromuscular disease is characterized by distinct neurologic signs and the primary differential diagnoses include Coonhound paralysis/acute polyradiculoneuritis, organophosphate toxicity, fulminant myasthenia gravis, botulism, tick paralysis, and polymyositis. In the case presented in this paper, history and diagnostics were used to identify acute polyradiculoneuritis as the most likely cause of clinical signs. Coonhound paralysis is an acute polyradiculoneuritis that is believed to be caused by an immune-mediated reaction to an antigen present in the saliva of a raccoon. Acute idiopathic polyradiculoneuritis is an identical syndrome except that there is no history of exposure to a raccoon. In the latter case, it is

presumed that another foreign antigen is responsible for the immune response. In either case, the foreign antigen resembles the individual's own gangliosides such that antibodies formed against the foreign antigen attack both that antigen and the patient's neural tissue. The result is an acute inflammation of the ventral nerve roots and subsequent demyelination with or without axonal degeneration. This results in the clinical signs of diffuse neuromuscular disease. Treatment is supportive, including adequate cushioning, frequent turning, and feeding in an upright position. The majority of dogs will recover in weeks to several months. title: Feline upper respiratory infection control in northeastern animal shelters
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 12). Feline upper respiratory infections are one of the leading causes of euthanasias of cats in animal shelters. This research involved designing and distributing a survey to animal shelters throughout New York and New England in order to acquire baseline data concerning shelter demographics and various aspects of upper respiratory infection control. The survey was divided into categories: housing, cleaning and disinfection, diets of shelter cats, stress reducing measures, staff / veterinary services, isolation facilities, treatment of URI cats, vaccination, foster care, euthanasias, and shelter demographics. This research will be used to design controlled studies to evaluatethe effectiveness of various preventive measures in reducing feline URI in shelters in the future. The goal is to make recommendations to improve control of upper respiratory infections in shelter cats. Dr. Jan Scarlett

title: Urolithiasis and chronic renal failure in an Arabian gelding
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 13). A 14-year-old Arabian gelding presented to the Cornell University Equine and Farm Animal Hospital Large Animal Medicine Service in August 2003 with a chief complaint of weight loss, polydipsia, polyuria, and dysuria. Upon rectal palpation, a large cystic calculus and bilaterally enlarged ureters were noted. The chemistry panel was consistent with renal failure and urinalysis showed isosthenuria. Further diagnostics included ultrasound of the kidneys, and endoscopy of the urinary bladder. During rectal examinations, the urolith was noted to rest at the trigone region, thereby possibly obstructing the ureters. The horse was stabilized on fluid therapy and a cystotomy was performed to remove the urolith. Post-operatively, renal

function was markedly improved, but the horse was ultimately euthanized due to Salmonellosis. Postmortem findings included severe hydronephrosis, hydroureter, and chronic severe cystitis. This case report illustrates the unusual relationship between chronic renal failure and cystic calculi in this horse. Jerome VanBiervliet

title: White muscle disease in foals
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf (13)). White muscle disease, also known as nutritional muscular dystrophy, is a degenerative disease that affects the skeletal and cardiac muscle of foals ranging in age from birth to 11 months. White muscle disease is prevalent in regions with seleniumdeficient soils. Selenium is a component of the enzyme glutathione peroxidase, which protects cell membranes against oxidation. Muscle cell membranes depend on normal body levels of selenium and vitamin E to avoid damage caused by oxygen reactive metabolites that are produced during normal cellular metabolism. (1, 2). A one-day-old colt presented to Cornell University Hospital for Animals with a chief complaint of being recumbent and unable to stand, poor suckling reflex, and discolored urine. Although the mare was 11 days past her expected due date, she had little udder development and milk production. In addition, the mare had retained placenta for 6-10 hours, and the placenta contained diffusely distributed abnormal red areas. On presentation, the foal was extremely depressed, unresponsive, and unable to stand. On physical examination, the foal appeared dehydrated, and a left sided systolic murmur was detected. The muscles were markedly firm to palpation, in special the gluteal muscles. Complete blood cell count (CBC), blood chemistry, acid-base status (ISAT), and urinalysis were performed and the following major problems were noted: neutrophilia with a left shift, mildly elevated packed cell volume, severe hyperkalemia, hyponatremia, hypochloremia, respiratory acidosis, azotemia, hyperglycemia, severely elevated muscle enzymes (CK and AST), and myoglobinuria. Thoracic and abdominal ultrasound examinations were unremarkable. Laboratorial tests for serum selenium and vitamin E levels, and whole blood glutathione-peroxidase (GSH-Px) activity were measured and indicated selenium deficiency. The primary problem list included white muscle disease, septicemia, and neonatal maladjustment syndrome. The foal was treated with fluid therapy, diuretics, broad-spectrum antibiotic therapy, selenium, vitamin E, nasogastric administration of milk, and gastric protectants. Dr. Flaminio. title: A case of a ventricular septal defect with bi-directional shunting in a Thoroughbred colt abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 11). "Cassette Player '03" Bilinski, a 7-month-old Thoroughbred colt, presented to the Cornell University Large Animal Medicine Service on August 25, 2003 with the chief complaint of a heart murmur. Three murmurs were heard upon cardiac auscultation: a grade III/VI systolic murmur over the aortic and mitral valve area, a grade III/VI systolic murmur over the pulmonic valve area, and a grade III/VI systolic murmur over the tricuspid valve area. Findings of a cardiology consult included a membranous ventricular septal defect with bi-directional shunting, mitral valve dysplasia, tricuspid valve dysplasia, and significant pulmonary hypertension. Due to the poor prognosis for athletic performance, the foal was euthanized and a necropsy was performed. This paper will discuss ventricular septal defects in the horse along with their clinical manifestations and varying prognoses. Factors which play a role in causing pulmonary hypertension and shunt reversal will also be discussed, particularly as they apply to this case. Dr. Jerome Van Biervliet

title: Abundance, Attention, and Access: Of Portals and Catalogs
abstract: The world's information resources are abundant, but time is a scarce commodity. The ideal discovery tool, therefore, is one which consults omnivorously, but which returns a selection of relevant results in rapid sequence. Searchers find what they need promptly without having to wade through a vast assortment of tangentially related, inaccurate, or otherwise deficient data. It costs little to build and operate, and it yields a high degree of user satisfaction because it delivers reliable information in a timely manner with relative

ease. Such a tool is still imaginary, although it could become a reality in the near future if librarians organize themselves appropriately and commit the resources to design it.

title: Using the Portal for the Discovery of Discipline-Based Electronic Resources
abstract: Contemporary society is at once omnivorous and highly selective. People today are coming to expect to have all manner of products and services at their fingertips, and simultaneously, they want them customized for a particular individual. You can order Levi's jeans programmed to your personal body specifications and conceivably, you could choose from any textile in the world to make a totally unique pair of pants. Nick Donatiello, president of Odyssey, a marketing research firm, speaking at the JSTOR American Library Association June 2001 meeting, noted the struggle of the big TV networks to retain market share in a world in which the consumer increasingly prefers to view content he has profiled to watch at his convenience. Since we can now access hundreds of channels through cable and satellite, the consumer wants a tool to filter the diverse content available. New devices such as TiVo enable viewers to create "My channel" through a definition of preferences. The software interprets the viewer's preferences from this profile and independently identifies categories of programs which are consistent with the consumer's taste and previous selections. In the world of books, we are familiar with this feature from Amazon's "Customers who bought this book also bought.."

title: A Thermal Model to Optimize Performance in Green Roofs
abstract: There is currently a lack of a comprehensive energy model for extensive green roof systems. To rectify this, a lumped parameter, one dimensional, time dependent thermal model and subsequent computer program were created to calculate temperature profiles and heat fluxes in extensive green roofs. It was found that varying the plant and soil characteristics did not have a significant effect on the temperature profile of the system. Additionally it was found through a flux analysis that utilizing a green roof produces significant energy savings. The created model allows the user to easily vary all the parameters and model any location.

title: Magnetic Properties Of Nanoscale Conductors
abstract: A Dissertation Presented to the Faculty of the Graduate School of Cornell University in Partial Fulfillment of the Requirements for the Degree of Doctor of PhilosophyThis doctoral dissertation examines some magnetic properties of nanoscale conductors. It comprises two classes of problems, namely, the response of closed nanoscopic systems to an external magnetic field, and the magnetization dependent transport of nanomagnets. In the first class of closed nanoscopic structures like quantum dots or metal grains, the system has discrete energy levels which can be modeled by Random Matrix Theory. The addition of a magnetic field is analyzed using a crossover random matrix model. In Chapter 2, we show that in the crossover there exist correlations between elements of the same eigenvector and between different eigenvectors. We show that these correlations between different eigenvectors lead to enhanced fluctuations of the electron-electron interaction matrix elements which are absent in the pure ensembles. In Chapter 3, we generalize these results to analyze the magnetic field response of energy levels in ultrasmall metal grains. We present a theory of mesoscopic fluctuations of g-tensors and avoided crossing energies in a small metal grain that contains both orbital and spin contributions to the g-tensor.
In the second class of problems we study two effects in small ferromagnets where the charge transport is coupled to the magnetization. In Chapter 4, we show that a sufficiently large unpolarized current can cause a spin-wave instability in a nanomagnet with asymmetric contacts. The dynamics beyond the instability is calculated analytically in the perturbative regime of small spinwave amplitudes, and numerically for larger currents. In Chapter 5, we study "anisotropic magnetoresistance fluctuations" which is the ferromagnetic analog of the well-known Universal Conductance Fluctuations in metals. The conductance of a ferromagnetic particle depends on the relative orientation of the magnetization with respect to the direction of current flow. This phenomenon is known as "anisotropic magnetoresistance" and has no counterpart in normal-metal conductors. We show that quantum interference leads to an additional, random yet (statistically) universal dependence of the conductance of a ferromagnet on the magnetization direction. The mechanism for these anisotropic magnetoresistance fluctuations is the interplay of spin-orbit scattering, random impurity scattering, and the ferromagnet's exchange field.

title: To cut or not to cut : analysis of caesarean sections in a New York state dairy herd
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 12). Pregnancy and parturition are necessary events in the initiation of milk production in mammalian species. Unfortunately, cows are at the highest risk of breaking during this transition period from late pregnancy to early lactation. The transition cow is subject to a variety of pathologic conditions, including dystocia, retained placenta, metritis, milk fever, ketosis, mastitis, and displacement of the abomasum. The interrelated nature of these diseases cannot be overemphasized; indeed, a strong positive correlation exists between many of them. Aside from the obvious losses due to death, veterinary intervention, and medications, the above conditions decrease revenue by means of lost milk production and/or decreased reproductive performance, the full impact of which may not be realized until much later in the lactation. Dystocia, or difficulty calving, is among the more common periparturient disorders. Causes can be fetal or maternal. When repositioning or traction cannot resolve dystocia, a fetotomy or cesarean section may be considered. Compared with cows that have vaginal delivery, those that undergo cesarean section have been shown to have a higher incidence of calf mortality, a longer calving interval following surgery, lower milk production during the first 100 DIM, and a higher likelihood of being culled. This presentation will examine preliminary data for

cows presented to the Teaching Hospital at the New York State College of Veterinary Medicine with chief complaint of dystocia and subsequently undergoing a cesarean section. By means of DC305 records, cows from a large herd were followed post-surgery to evaluate production and reproductive parameters.Charles L. Guard, Amir Rosenbaum

title: Probable electrocution in a quarter horse stallion
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 11). Although electrocution is widely reported in the human literature, there are no welldocumented cases reported in horses. A probable diagnosis of electric shock injury was made in the case of an 18 year old Quarter Horse breeding stallion that presented to the Cornell University Hospital for Animals with a chief complaint of seizure-like activity following loss of electrical power at the farm. Pertinent physical exam findings included hyperhidrosis, diffuse muscle fasciculations and contractions, and severe ataxia involving all four limbs. A complete blood count revealed a marked leukocytosis, characterized by a neutrophilia and eosinophilia. The neurologic signs resolved within 18 hours of presentation with minimal therapeutic intervention. Ventricular tachycardia without associated clinical signs developed 20 hours following presentation, and resolved without treatment. The rapid and complete recovery made an infectious process or structural lesion highly unlikely, leading to a presumptive diagnosis of electrocution. Dr. Monica Figueiredo, Dr. Julia Flaminio

abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 10-11). Kipper, a five-year-old Pembroke Welsh Corgi, presented to his referring veterinarian for an oral mass, which a biopsy identified to be squamous cell carcinoma. The dog was referred to Cornell for staging and treatment. Kipper was systemically healthy and had no evidence of metastatic disease. A partial rostral mandibulectomy was performed to remove the tumor with wide margins. This paper discusses the biologic behavior of oral squamous cell carcinoma and compares it to other oral neoplasms in the dog. Treatment options and prognostic factors for dogs with oral tumors are also presented. Dr. Dennis Bailey

title: Hemotropic mycoplasmosis in a cat
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 13). This is a case study of Feline Hemotropic Mycoplasmosis (previously known as Feline Haemobartonellosis) in a young adult male feline with the sudden onset of signs associated with hemolytic anemia. Feline Hemotropic Mycoplasmosis (or FHM) is a "parasitic" infection of the red blood cells that results in both intravascular and extravascular hemolysis. There are two etiologic agents that infect feline red blood cells: Mycoplasma haemofelis (large form) and Mycoplasma haemominutum (small form). Mycoplasma haemofelis was previously known as the Rickettsial agent Haemobartonella felis. It was recently reclassified due to new information from PCR, Western Blot, and DNA Sequencing tests. Presenting complaint is commonly the sudden onset of behavior changes, lethargy, weakness, and/or pale, icteric mucous membranes. Diagnosis is based on blood smear evaluation. PCR assays are also available. Treatment involves a 3 week course of oral tetracyclines; doxycycline is the drug of choice at 5mg/kg once daily. Glucocorticoids may be administered to reduce extravascular hemolysis. Prognosis of uncomplicated FHM with treatment is excellent although affected cats remain carriers of the organism for life. Concurrent immunosuppression can result in death during the acute phase of the disease or recrudescence of the disease from the carrier state. Dr. Jennifer McCabe

title: Platelet function and dysfunction : hereditary canine thrombopathias
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 19). Platelets are essential in maintaining the delicate balance between the fluidity of blood and the retention of blood within damaged vessels. Not only do platelets form hemostatic plugs that prevent bleeding from vascular defects, but they also set the stage for the coagulation cascade. Hereditary disorders of platelet function are traditionally classified as resulting from abnormalities in platelet adhesion, aggregation or secretion. In reviewing the known canine thrombopathias, we emphasize the importance of each normal platelet function in hemostasis. Special attention is given to a new platelet defect in German Shepherd dogs that is being investigated in the author's laboratory. This defect highlights the importance of a fourth, often overlooked, platelet function called platelet procoagulant activity (PCA). It is this PCA that allows platelets to bridge primary and secondary hemostasis. We also outline a strategy to diagnose a bleeding patient with a primary hemostatic defect and review the treatment options for that patient. Dr. Marjory Brooks

title: Fractures of the radius and ulna secondary to possible vitamin D deficiency in captive polar bears (ursus maritimus)
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 13-14). Fractures in captive polar bears are not uncommon. The purpose of this study was to identify any common etiologic factors in cases of antebrachial fractures in captive polar bears and to evaluate the success of fracture repair in these animals. Furthermore, there has been no case report published on fracture repair in any bear species. It was hypothesized that a certain percentage of fractures in polar bears could be due to

decreased mineral density in the affected bones secondary to vitamin or mineral deficits, specifically deficits of Vitamin D, calcium or phosphorus. Decreased Vitamin D intake or availability combined with lack of exercise (captivity) could lead to decreased bone density and strength and thus, predispose bones to fracture. Serum 25-OH-Vitamin D values in several polar bears were low. Results of this study suggest that internal fixation of antebrachial fractures is feasible, reasonably tolerated by the animal, and has been successful. Additional research is necessary to explore the role of nutrition in polar bear fracture disease. Emmanuel Engeli, Med. Vet., DACVS; Laurie R. Goodrich DVM, MS, DACVS; Allan W. Prowton DVM

title: A case of multicentric enzootic lymphoma in a Holstein cow
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 10). A 5 year old Holstein cow presented to Cornell's Large Animal Medicine Service with a chief complaint of anorexia, depression, and decreased milk production. Abnormalities detected during physical examination and initial diagnostic evaluation included an abomasal mass, enlarged lymph nodes, and a lymphocytosis. A presumptive diagnosis of enzootic lymphoma was made, which was confirmed by the presence of lymphoblasts within a sample of peritoneal fluid obtained via abdominocentesis. The cow was euthanized, and both gross and histologic findings were consistent with the clinical diagnosis of lymphoma. Bovine enzootic lymphoma will be discussed with an emphasis placed on the bovine leukosis virus. Dr. Rachel Gardner

title: "Seizures" in a cocker spaniel dog
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 12-15). A five-year-old female Cocker Spaniel dog was presented for a sudden onset of severe vestibular dysequilibrum. Long tract signs indicated central vestibular disease and the lesion was localized to the caudal fossa. Computed tomography demonstrated a large (20 mm x 20 mm x 12 mm), homogenous, hypoattentuating mass ventral to the cerebellum showing slight peripheral ring enhancement with intravenous contrast medium. Severe syringohydromyelia was detected in the C1 and C2 spinal cord segments. Postmortem examination found a mass filled with viscid fluid dorsal to medulla oblongata with severe compression of the overlying cerebellum. On histopathology, the mass was diagnosed as epidermoid cyst. Extensive syringohydromyelia and obstructive hydrocephalus were also identified secondary to the caudal fossa cyst. title: Management of feline diabetes mellitus
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 11). Sarah, a 14 year old female spayed domestic shorthair cat, presented to the Cornell University Hospital for Animals with a chief complaint of polyuria, polydipsia, polyphagia and weight loss of several weeks duration with a recent onset of weakness, lethargy and anorexia. Clinical findings on physical examination and diagnostic evaluation included thin body condition, dehydration, hyperglycemia, glucosuria, ketonuria, and electrolyte and acid-base abnormalities. A diagnosis of diabetes mellitus with ketoacidosis was made and insulin and fluid therapy were instituted. Sarah was initially sent home on Humulin-N NPH insulin twice daily. A recheck 3 weeks later revealed persistent hyperglycemia and elevated fructosamine level. In addition, she remained symptomatic for her diabetes mellitus. Over the next several months, serial blood glucose curves and fructosamine levels were performed to help evaluate her glycemic control. A discussion of the dietary and medical management strategies of diabetes mellitus, as applied in Sarah's case will be reviewed. Dr. John Randolph

title: Drug induced immune mediated hemolytic anemia in a quarter horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf (8)). A 9 year old dun Quarter Horse gelding presented to the Large Animal Hospital at Cornell University on August 13, 2003 for fever, lethargy, and anorexia. One week prior, this horse had received a wound to his right carpus. He was treated concomitantly with procaine penicillin, trimethoprim-sulfa, and non-steroidal anti-inflammatories. Five days after therapy was initiated, the horse began to show signs of systemic illness, including fever and lethargy. His clinical signs deteriorated as he became more lethargic and anorexic and was noted to urinate dark brown urine. He was then referred to Cornell for further evaluation. Clinical signs at presentation suggested hemolytic anemia. This paper will further discuss the differentials for equine hemolytic anemia and will specifically focus on drug induced IMHA. title: Canine degenerative corneal endothelial disease and the management of the disease in the private practice
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 13-15). Alex Poe is a 15-year old mixed breed canine with a year and a half history of bilateral refractory corneal erosion and opacity. Diseases leading to refractory canine corneal erosion are frustrating to handle in a clinical situation unless an appropriate pathologic diagnosis is made. Primary causes of corneal erosion include persistent mechanical irritation, primary corneal epithelial disease, or primary corneal endothelial disease. Conventional therapies for corneal epithelial and corneal endothelial diseases have differed only in the administration of hyperosmotic agents in cases of primary endothelial disease. However, historically primary endothelial disease patients have remained refractory to therapy due to the inability to control corneal edema leading to bullous keratopathy and persistent ulceration. The use of a cautery probe to perform thermokeratoplasty on the cornea has been used in human patients in the past and has shown promise in treating canine corneal endothelial disease. title: Phacoemulsification and implantation of intraocular lenses in a diabetic dog
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 13). Cataracts are a leading cause of blindness in dogs. Diabetes mellitus is the most common cause of metabolic cataracts in dogs. Once the diagnosis of cataracts has been made 50-70% of dogs will develop cataracts within six to twelve months. Currently, phacoemulsification is the preferred technique for removal of cataracts. Following surgical removal of a cataractous lens, vision is dramatically improved. However, an eye without a lens is far-sighted since the lens is not present to focus incoming light onto the retina. With implantation of an intraocular lens, incoming light rays are focused such that the focal point is at the retinal plane, improving

vision. Dr. Thomas Kern

title: The management of severe, chronic laminitis in a horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 14). "Hopper", a 10-year-old Morgan gelding, was evaluated for non-weight-bearing right thoracic limb lameness in June 2003. In April 2003, Hopper had been evaluated for left thoracic limb lameness. A diagnosis of white

line disease affecting all four hooves was made, but laminitis was suspected to have been an initiating factor. Upon presentation in June, radiographs revealed severe, bilateral laminitis with hoof abscesses in the right hoof. Treatments included bilateral forelimb dorsal hoof wall resections, bilateral regional antibiotic perfusion, and administration of intravenous and oral antibiotics, analgesics and vasodilators. Serial radiography was performed to monitor the course of the disease and identify possible hoof abscesses. Contrast studies of the digital vasculature were performed. Hopper was discharged in August 2003 with a grave prognosis. Michael Schramme

title: Renal failure secondary to ascending urinary tract infection and pyelonephritis in a horse
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 11-12). Pyelonephritis is an uncommon cause of renal failure in the horse. The horses with the highest risk for urinary tract infections and pyelonephritis are multiparous mares with a history of dystocia, bladder paralysis, urinary incontinence, or urolithiasis. Bacteria cultured from urinary tract infections and pyelonephritis are typically coliforms or normal skin flora. Successful management of renal failure is largely dependent on early diagnosis. The case presented is of a nine year old, Quarter Horse brood mare with a typical history for a subacute pyelonephritis that was complicated by a chronic hydronephrosis in the contralateral kidney. title: Pseudothrombocytopenia in a 4 month old Thoroughbred filly
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf (13)). This is the case report of a 4 month old Thoroughbred filly, with an unknown medical history, that was diagnosed with pseudothrombocytopenia. The foal was physically healthy with no evidence of bleeding. Initial bloodwork, from EDTA-anticoagulated blood, revealed a platelet count of 24 thou/uL. Differential diagnoses included alloimmune thrombocytopenia, immune mediated thrombocytopenia, EDTA dependent pseudothrombocytopenia and pseudothrombocytopenia from other causes. Subsequent bloodwork demonstrated increasing platelet counts. However, blood submitted to separate laboratories produced variable results. A correlation with of platelet count with the amount of time from collection to processing was observed. The foal's apparent thrombocytopenia resolved without treatment, diagnosis of an underlying disease, or development of clinical signs. Dr. Gillian Perkins, Dr. Amy Leibeck

title: Eccrine adenocarcinoma in a cat's paw
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 12). A geriatric, male castrate, American Domestic Shorthair cat was presented to Cornell University Hospital for Animals (CUHA) for evaluation of an eccrine adenocarcinoma involving the right metacarpal pad. Bleeding associated with the right front paw was first noticed by the owners in August of 2003. The cat presented to the referring veterinarian on August 26th 2003, at which time an ulcerated mass was noted on the right metacarpal pad. An incisional biopsy was obtained, and histopathologic assessment was consistent with an eccrine adenocarcinoma. Two-view thoracic radiographs were unremarkable. A complete blood count, chemistry panel, and urinalysis were performed. The chemistry panel revealed renal parameters at the upper end of normal [creatinine = 2.0 mg/dL (0.7-2.1mg/dL), BUN = 33.1mg/dL (17-35mg/dL), phosphate = 13.3mg/dL (3.0-6.6mg/dL)]. Urine specific gravity was >1.045, and occasional cocci were seen in urinary sediment. The cat was treated with enrofloxacin for the urinary tract infection. On presentation to the Oncology Service at the CUHA, the cat was quiet but alert and responsive. Physical examination confirmed an ulcerated mass associated with the right metacarpal pad that measured 1.0 x 1.0 x 0.5cm. The mass was not painful on palpation, and the cat showed no signs of lameness. Thoracic auscultation was unremarkable. Abdominal palpation revealed no abnormalities. All peripheral lymph nodes palpated normal in size and consistency. The remainder of the physical exam was unremarkable. A complete blood count, chemistry panel, and urinalysis were performed. Results showed no significant abnormalities. The two lateral thoracic referral radiographs were reviewed, a third dorsoventral view was obtained, and an abdominal ultrasound was performed. No evidence of metastatic diseases was identified in either imaging modality. Slides from the initial metacarpal biopsy were reviewed by the CUHA Surgical Biopsy Service, and confirmed a sweat gland carcinoma. The described diagnostic evaluation generated a problem list that consisted of a mildly overconditioned, mildly stressed, geriatric, male castrated feline, with an ulcerated right metacarpal sweat gland carcinoma. Forelimb amputation was recommended by the CUHA Oncology Service as the primary

treatment to provide local control and the best long-term prognosis. Locally aggressive resection combined with radiation therapy was suggested as an alternative treatment, but was declined by the owners due to uncertain efficacy. Dr. Michael Rozmanec, Dr. Amanda McNabb, Dr. Dennis Bailey

title: Diagnosis, Pathophysiology and Treatment of Glomerulopathy in a Dog
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaves 15-16). A nine-year-old, female spayed Norwegian Elkhound presented to Cornell University Hospital for Animals on 9/18/03 with a chief complaint of renal disease and anemia. Significant findings on physical examination and diagnostic workup included thin body condition, grade 2/6 systolic murmur, non-regenerative anemia, proteinuria, azotemia, hypoalbuminemia, hyperphosphatemia, hypertension as well as multiple splenic and a single hepatic nodule. These findings were consistent with a glomerulopathy, but without biopsy glomerulonephritis could not be distinguished from amyloidosis. Pathogenesis of glomerular disease in Inga's case may include Lyme nephritis, immune complex glomerulonephritis secondary to neoplasia, amyloidosis or another unidentified cause. Inga was treated with multiple supportive therapies such as enalapril, amlodipine, famotidine, subcutaneous fluids and Epogen. Despite initial improvement in quality of life, Inga deteriorated in mid-October 2003 and was euthanized by her referring veterinarian. Dr. Jennifer McCabe, DVM

title: The economics of a boarding kennel in a veterinary hospital
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 6). There are over 280 million people in the United States, and over 140 million cats and dogs. This paper investigates the economics of operating a boarding facility as an ancillary business to a small animal veterinary practice. The case study concentrates on a one doctor, small animal veterinary hospital, and reveals that the clinic's profit from the boarding facility is minimal, and steadily diminishing. The financial information is extrapolated into the hypothetical construction of a new veterinary facility to determine if including a boarding facility as part of a new hospital design is a wise economical decision in today's economic environment. title: HOW ADULTS CONSTRUCT FOOD CHOICE: CATEGORIES, CONTEXTS, AND SCRIPTS
abstract: Carole A. Bisogni; Jeffery Sobal; Edward A. Frongillo Jr.; Gretel H. Pelto; Martha H. Stipanuk People are more likely to accept, integrate, and act on nutrition information that corresponds with their food cognitions. The purpose of this project was to explore and describe how adults construct food choices using schema theory as a way to understand food cognitions. Forty-two purposively recruited, employed US adults completed repeated card-sort tasks and in-depth, qualitative interviews related to different eating contexts. They sorted 59 food cards across multiple contexts. These data were analyzed for the types of categories that participants used to organize the cards using grounded theory approaches. Personal-experience-based ways of classifying were specific to the individual. Context-based ways of classifying were related to different

characteristics of eating episodes. Food-based ways of classifying were related to properties of food. Cluster analysis was used to identify clusters of participants according to salience of their ways of classifying the food cards. Seven clusters were identified. To gain understanding of how participants constructed food choice in a specific eating episode, the researcher analyzed passages from the interview transcripts related to the evening meal. Analysis identified participants' scripts for this meal in terms of interconnected dominant values, general expectations, and plans that included strategies and procedures. Scripts varied in scope and flexibility. The following eight kinds of scripts were identified and labeled using participants words: "providing dinner for my family," "head of the table cooks," "head of the table does not cook," "trying unsuccessfully to have a family meal," "share the work," "anything goes," and "live alone entertaining." The application of schema theory provided important insights into the mental processes involved in food choice. Individuals' unique food schemas consist of rich and complex categories that are differentially accessed depending on the food context. Food choice scripts demonstrate how individuals' mental processes are linked to behavior. These findings provide insights useful to nutrition professionals interested in promoting adoption of healthy eating habits.Support was provided by the Cornell University Agricultural Experimental Station, USDA-CREES, Hatch Project #NYC3994223 and the National Institutes of Health Training Grant #2 T32 DK07158-27.

title: Hyperviscosity syndrome in a dog with IgM secreting lymphoma
abstract: Senior seminar (D.V.M.)--Cornell University, 2004. Includes bibliographical references (leaf 8). On June 13, 2003 a 6 year old intact female beagle, "Molly", presented with the major complaint of buphthalmia and red eye. She was previously diagnosed and treated by her veterinarian for glaucoma. She was referred to Cornell for further examination. After an ophthalmic examination, Molly was diagnosed with hyperviscosity syndrome. Hyperviscosity syndrome is a rare condition associated with an increase in the concentration of macroglobulins in the blood. There are various manifestations of hyperviscosity syndrome with paraproteinaemicus retinopathy (tortuous, distended retinal veins) being pathognomonic. Other manifestations of hyperviscosity syndrome are hemorrhaging, especially retinal and gastrointestinal, visual defects, and neurologic deficits. Causes of hyperviscosity syndrome include multiple myeloma, chronic lymphocytic leukemia, primary (Waldenstrom's) macroglobulinemia, and lymphosarcoma with monoclonal elaboration of IgM, IgA, and IgG immunoglobulin and light chain protein classes. After an extensive diagnostic work up it was determined that Molly had a IgM secreting lymphoma of possible B-cell origin. Hyperviscosity is treated by reducing serum viscosity. This is best accomplished by treating the primary disease. Appropriate chemotherapy for Molly's lymphoma consists of the CHOP protocol which consists of L-asparaginase, prednisone, doxorubicin, cyclophosphamide, and vincristine. This would have been the most optimal treatment for this dog. However, the owner elected to forgo expensive chemotherapy and treat Molly with a pallative course of prednisone. Dr. Kathrene Cutter

title: An extreme case of masticatory myositis
abstract: Senior seminar (D.V.M.)--Cornell University, 2005. Includes bibliographical references (leaf [13]). Lucy, an 8-year-old female spayed Labrador retriever mix, presented to the Triage Service at Cornell University Hospital for Animals due to signs of respiratory distress. Lucy's owner indicated a history of inappetance, intermittent cough, and difficulty walking for the past two weeks. Initially, Lucy presented to the referring

veterinarian (rDVM) who recorded a right hindlimb lameness, fever of 104.3 degrees Fahrenheit, and tachypnea. Cephalexin was prescribed to treat a possible bronchitis seen on chest radiographs. The following day she re-presented to the rDVM. Serum chemistry revealed a mildly increased alkaline phosphatase (ALP). Tachypnea was still evident yet her lungs ausculted normally, so a week-long course of Deramaxx for possible blunt trauma to the chest was initiated. Ptyalism, progressive intermittent inappetance, and white mucoid sputum were observed for several days. She was rechecked by the rDVM one week later, at which time a complete blood count (CBC) documented a leukocytosis. Heartworm test was negative at this time. She was treated with more cephalexin, aminophylline as a bronchodilator, and instructions for nebulization and coupage at home. Within five days, Lucy stopped drinking abruptly, and would only eat via syringe force-feeding. Her owner mentioned that she did not tolerate pilled medications; Lucy had become increasingly stubborn over the last several days and would clench her mouth shut when her owner attempted to medicate her. After approximately two weeks since her original symptoms, Lucy presented to Cornell.

title: Case report of an orbital inflammatory myofibroblastic tumor in a dog
abstract: Senior seminar (D.V.M.)--Cornell University, 2005. Includes bibliographical references (leaf 8). The inflammatory myofibroblastic tumor (IMT) has been only fairly recently identified and studied in human medicine. It is commonly found as a primary lung tumor, and most often affects children and young adults. It is usually benign, with a low rate of recurrence and low metatstatic potential. However, diagnosis of this neoplasm is often confusing and controversial, making the potential for misdiagnosis high. The IMT is virtually unheard of in veterinary medicine. Thus, it is with great excitement that we present a case report of an orbital inflammatory myofibroblastic tumor in a dog with the hope of bringing the IMT into the consciousness of mainstream veterinary medicine. title: Cellular and molecular studies of ciliary neurotrophic factor receptor alpha expression and ciliary neurotrophic factor mediated neuroprotection in the canine retina
abstract: Over the past decades, extensive new knowledge on the cellular and molecular mechanisms of vision has been acquired. During the genomic era, numerous genes involved in retinal function have been identified, some of which have been causally associated with various forms of retinal disorders. Despite this rapid progress in the understanding of retinal biology, retinal degeneration, the most common cause of blindness in the developed world remains an untreatable condition. A therapeutic strategy that has been tested in several animal models of retinal degeneration has been to deliver intraocularly a survival factor, ciliary neurotrophic factor (CNTF), in an attempt to rescue photoreceptor cells prior to cell death.

To begin addressing the question about the mechanism of CNTF-mediated neuroprotection, the retinal expression of the specific receptor for CNTF (CNTFRalpha) was characterized. Using different molecular approaches, we found that photoreceptor cells from non-rodent mammalian species (including dog and human) express CNTFRalpha. This led to the conclusion that in these species, a CNTF- mediated photoreceptor rescue effect would most likely result from the direct activation of a pro-survival response in rods and cones.

The underlying expectation in testing CNTF as a potential treatment for retinitis pigmentosa (RP) and allied disorders is that it may provide a means of protecting photoreceptor cells regardless of the genetic and/or environmental causes of the disease. This hypothesis is based on the evidence that CNTF rescues

photoreceptors in several non-allelic animal models of RP. One such model has been rcd1, a canine form of early-onset and rapidly progressing retinal degeneration caused by a mutation in the PDE6B gene. In this work, we evaluated whether CNTF could also rescue photoreceptors in XLPRA2, another early-onset canine model of RP caused by a mutation in a different gene (RPGR exon ORF15). The characterization of the histological stages of the disease, and the examination of the kinetics of cell death provided time-points to optimally test CNTF's neuroprotective effect in this model. Intravitreal injections of CNTF in XLPRA2 at these determined ages failed to show any significant rescue from cell death, and caused some abnormal peripheral retina remodeling that was disease- and age-specific.

title: Retrospective study of canine and feline immune-mediated pancytopenia
abstract: Senior seminar (D.V.M.)--Cornell University, 2005. Includes bibliographical references (leaf 11). A retrospective study of canine and feline pancytopenia presumably due to immunemediated destruction of blood cell precursors in bone marrow was conducted to characterize the clinical signs, laboratory test results, treatment and outcome of this condition. CUHA case records between 1994-2004 were reviewed and animals were included in the study if they fulfilled the following criteria: several days history of pancytopenia, hyperplasia of one or more cell lines in the bone marrow, absence of morphologic abnormalities in bone marrow precursors, no evidence of peripheral destruction, and no known underlying disease or drug therapy that could have caused the pancytopenia. Seven canine and 4 feline cases were included. Animals were generally young and female, and exhibited vague clinical signs such as lethargy and anorexia. Bone marrow aspirates were hypercellular with erythroid hypoplasia in dogs and erythroid hyperplasia in cats. Both responded well to immunosuppressive therapy over days to weeks. Therefore, an immune-mediated pathogenesis should be considered for dogs and cats presenting with pancytopenia due to ineffective hematopoiesis. Dr. Tracy Stokol

title: <HAVE + PERFECT PARTICIPLE> IN ROMANCE AND ENGLISH: SYNCHRONY AND DIACHRONY
abstract: At first glance, the development of the Romance and Germanic have-perfects would seem to be well understood. The surface form of the source syntagma is uncontroversial and there is an abundant, inveterate literature that analyzes the emergence of have as an auxiliary. The "endpoints" of the development may be superficially described as follows (for English): (1) OE Ic hine ofslaegenne haebbe > Eng I have slain him The traditional view is that the source syntagma, <have + noun.ACC + perfect participle>, is structured [have [noun participle]], and that this syntagma undergoes change as have loses its possessive meaning. In this dissertation, I demonstrate that the traditional view is untenable and readdress two fundamental questions about the development of have-perfects: (i) how is the early ability of have to predicate possession connected with its later role in the perfect?; (ii) what are the syntactic structures and meanings of <have + noun.ACC + perfect participle> before the emergence of the have-perfect? With corpus evidence, I show that that the surface string <have + noun.ACC + perfect participle> corresponds to three different structures in Old English and Latin; all of these survive into modern English and the Romance languages. I propose that the likeliest source of the have-perfect is the structure exemplified in: (2) Now he has his opponent cornered.
Sentences like (2), amply attested in Latin and Old English, contain an aspectual periphrasis that potentially describes two stages of a complex situation: the subject?s achievement of a result and a persisting resultant state. I hypothesize that the structure exemplified in (2) only became available after have had undergone semantic widening and entered into a systematic association with other expressions of possession and pertaining.
I also devote considerable attention to the differing values <have + perfect participle>. Though English and the Romance languages all have a formally equivalent verbal construction, the time reference of this "same" construction varies significantly across languages. I argue that the value of <have + perfect participle> in a given language is best understood, synchronically and diachronically, in terms of the values of the verb forms that it complements.

title: A MEASUREMENT OF THE INCLUSIVE BRANCHING RATIO OF CHARGED AND NEUTRAL D MESON DECAYS CONTAINING A NEUTRINO

abstract: Jim Alexander, Rich Galik, Tung-Mow YanThis thesis reports the measurement of branching ratios for the inclusive decay of a D meson to a neutrino, measured at the CLEO-c detector. It is fully inclusive as to lepton flavor and into which semileptonic mode the D decays. This analysis is the first direct measurement of the inclusive neutrino branching ratio. It utilizes 187 pb^{-1} of data taken at the $\psiprime$ resonance. The measured values are $BR(D^{\pm} \rightarrow X\nu) = 29.43\% \pm 0.83 \pm 1.75$, and $BR(D^0 \rightarrow X\nu) = 13.52\% \pm 0.28 \pm 0.68$.

title: GENDER INEQUALITY ACROSS SECTORS IN URBAN CHINA
abstract: In the debate about the stratification order during social transitions in former socialist countries, little research is done about changes in gender inequality in these countries. In this paper, I examine the differences in gender inequality between the public and private economic sectors in China, and the distinct mechanisms of change for the gender stratification order in the workplace. Data analysis shows that there is a dramatic difference. There is a very small or zero gender inequality in the public sector in coastal Chinese cities, where the market economy has developed faster than in other regions of China. However, gender inequality is significant in the private sector in all the cities in the data set with or without controlling for human capital, family status, and political capital. Close examination of the institutions before the social transition shows that there is a powerful institutional system that tries to minimize gender differences in employment. During the market transition, this system continues to exist in the public sector; while in the newly emerging private sector, these institutions do not appear. Gender stratification has different mechanisms of change during social transitions than the stratifications based on social capital, political capital, and human capital. Women do not have the resources bonded with gender in the newly emerging market economy that would allow them to maintain their positions in the gender stratification order. Without the support of institutions, the gender stratification order exhibits a discontinuity in the private sector.Cornell University Sage Fellowship

title: Neoliberal Developmentalism:State-led Economic Liberalization in China
abstract: On the question of state-market relations, the neoclassical economic view regards a minimal state as essential for economic growth. The statist view in political economy studies, on the other hand, stresses the active role of the state in promoting economic development. Both views tend to treat "state" and "market" as opposing forces: A developmental state is associated with industrial planning and active interventionist measures to "govern the market", whereas market-conforming liberalization is usually seen as a sign of the state's retreat in the face of globalized market forces. My study of economic reforms in China, however, indicates that a state may pursue market-conforming liberalization to advance its developmental goals.
This dissertation seeks to account for the logic behind the apparent anomaly of state-market relations in the course of China's economic reform through examining the reform processes of key economic sectors. The study pays special attention to the historical and institutional contexts where reforms took place and evolved and uses institutional change and the ensuing socioeconomic dynamics to explain the course and outcome of the reforms. It argues that administrative decentralization in China changed the Chinese state's internal structure and in turn adversely affected the central state's autonomy and policy enforcement capacity. To regain state authority and control, central policy makers resorted to market-conforming liberalization.

Rather than the state intervening in the market or the state giving way to market forces, this process entails the Chinese state's effort to re-create a developmental state through the creation of a liberal market.

title: AN EXPLORATORY STUDY OF THE TERRESTRIAL BIOGEOCHEMICAL SILICON CYCLE AT A FORESTED WATERSHED IN NORTHERN VERMONT
abstract: The importance of the global silicon cycle is becoming increasingly recognized because of its role in the consumption of atmospheric CO2. However, the terrestrial component of the silicon cycle is insufficiently understood, especially in temperate regions, since the majority of past research has ignored the effects of vegetation on the cycle. This study examines the terrestrial biogeochemical silicon cycle at a 40.5-ha sub-basin of the Sleepers River Research Watershed in Danville, VT. In particular, we examine the role of plants in the silicon cycle by analyzing silicon and germanium in plant leaves and cores, stream water, groundwater, soil water, bedrock, and soil obtained throughout 2005 from the watershed. Our results show that the amount of Si cycled by the vegetation is roughly the same as the amount weathered from bedrock and soil minerals. We also predict significant storage of Si in phytoliths in both the soil and the living biomass, slowing the rate of Si export from the watershed. Additionally, there appears to be a seasonal shift in the source of Si to the stream. We suggest this is because phytolith dissolution contributes more significantly in the early growing season than late in the season, when stream-flow is dominated by Si derived from mineral weathering.NSF, New York State Space Grant

title: Influences of past agriculture and present environment on plant distributions: Population ecology of three fern species in central New York
abstract: The development of forests on abandoned agricultural lands provides an ideal context to examine the relative roles of disturbance history and environmental conditions in shaping plant communities. Herbaceous plants typical of uncleared forests may remain absent from forests regrowing after agriculture, either because dispersal limits their distributions, or because lasting environmental changes limit their ability to establish and persist. Here I investigate how these processes affect plant distributions across the post-agricultural landscape of central New York, focusing on three fern species.

First I review relevant literature on the recolonization of post-agricultural forests by herbaceous plants. Next, in 20 adjacent pairs of forests that were never cleared for agriculture and forests that established 85-100 years ago on plowed fields, I assess the influence of past agriculture on present environmental conditions, including tree community structure and composition, soil physical and chemical properties and light availability. Compared to soils of adjacent uncleared stands, post-agricultural forest soils were similar in physical properties and chemical properties associated with pH, but had less organic matter, carbon and phosphorus, and reduced spatial heterogeneity in pH and water content. I examine how individual species interact with post-agricultural habitats by comparing the demography of three fern species with contrasting distributions across forests of different history, Dryopteris carthusiana, Dryopteris intermedia, and Polystichum acrostichoides, using descriptive and experimental approaches to specify which life history stages limit colonization, and which traits explain the species? distributions. Among the three species and between forests types, I compare the size and fecundity of adult plants; the deposition and storage of spores;

the reproductive success and selfing ability of gametophytes; rates of germination and establishment in various microsites; and the distribution of juvenile plants across these microsites. As adult plants of all three species had similar or greater performance in post-agricultural forests, and spore availability far exceeded recruitment rates, the availability of suitable sites for establishment appeared to limit population growth and spread. In both field and laboratory experiments, the species? reproductive success and selfing ability matched their distributions, suggesting that selfing may facilitate colonization in these species, and their reproductive biology may determine their distributions.The New York State Biodiversity Research Institute, the Andrew W. Mellon Foundation, the McIntire-Stennis program, a Sigma Xi Grant-in-Aid of Research and a National Science Foundation Graduate Research Fellowship.

title: QUANTIFYING DISTURBANCE FACTORS AND EFFECTS IN COMMON TERNS (STERNA HIRUNDO) USING VISUAL, AUDIO, AND REPRODUCTIVE DATA
abstract: The common tern is designated as a species of special concern in Upstate New York. The largest inland tern colony in New York is located on Oneida Lake, which is habitat to many other colonial waterbird species and an area of high human use during the tern breeding season. In addition to disturbances caused by recreational use, Oneida Lake's common terns are exposed to potential disturbances from tern research and cormorant management. Researchers intensively monitor tern nests during the breeding season, and USDA-APHIS participates in a lake-wide hazing program to control double-crested cormorants (Phalacrocorax auritus). The goal of this study was to discern and describe disturbances which might affect the projected sustainability of the common tern colony on Oneida Lake.

To evaluate the status of common terns on Oneida Lake, reproductive and population data were gathered. In order to classify, quantify, and evaluate the extent of human disturbance to the tern colony, I observed the colony during the summer of 2003 and collected visual and audio data of potentially disturbing events and the terns' reactions. Analyses of these data were performed using conventional statistics and Raven spectrogram analysis software. 22 Common tern population and reproductive parameters from 2003 were examined for deviation from patterns established by 1979-2002 data. Additionally, I examined differences in reproductive data among the different islands where terns nested in 2003. An estimated 449 pairs of terns established 621 nests in 2003. A total of 952 chicks hatched from 1587 eggs in 362 nests over the season, and 389 chicks fledged. These numbers are comparable or higher than those of past years and indicate that the Oneida Lake colony seems to be maintaining its population. Nests on Little Island were more likely to hatch than those on other islands. Further study is needed to determine why significant (at alpha=0.05) differences in nest fates among breeding islands occur I classified disturbances to the tern colony on Oneida Lake as relating to tern researchers, the USDA-APHIS cormorant hazing program, recreational watercraft, aircraft, and natural phenomena. The terns' behavioral and audio responses were quantified. Significant differences among disturbance categories were demonstrated through ANOVAS ($F=14.82$, $df=5$, $p < 0.001$; $F=22.77$, $df=5$, $p<0.001$). Tukey's test of multiple comparisons yielded significant differences in disturbance-related window counts including differences between controls and both researcher and natural disturbance categories (27.9 vs. 105 terns/minute, $d=7.47$, $p<0.001$, 27.9 vs. 72.9 terns/minute, $d=5.50$, $p<0.001$) and the researcher disturbance category and watercraft, hazing, and aircraft disturbance categories (105 vs. 43.5 terns/minute, $d=5.68$, $p< 0.001$, 105 vs. 39.2 terns/minute, $d=6.00$, $p< 0.001$, 105 vs. 39.0 terns/minute, $d=3.81$, $p=0.0027$). Audio analysis demonstrated significant differences in alarm calls given between controls and researcher disturbance (53.1 kip/min vs. 140 kip/min, $p<0.001$) and watercraft disturbance categories (53.1 kip/min vs. 106 kip/min, $p<0.001$).

Tern research activities appeared to cause the most disturbance. Further research is needed to quantify

potential impacts of cormorant hazing programs on common terns The tern colony seems self-sustaining, but studies to determine the effects of less intense nest monitoring on common tern reproductive output are needed. Innovative and less intrusive techniques for measuring nesting efforts could benefit both the study species and those attempting to manage it.USDA-APHIS

title: Historic Interior Documentation: A Case Study
abstract: This is a study of the documentation process of historical interiors, which examines the need for a procedure that records, evaluates, and documents interior architecture. An interior space can be recreated, restored, conserved or interpreted. I seek to demonstrate that a systematic approach to the documentation process is necessary to promote and further enhance the exchange of information regarding historical interiors within the preservation field. Consideration was given to the impact of such a system on the growing interest in historic interiors. Interdisciplinary approaches, including the fields of architecture, interior design, museum science, and historic preservation, were extensively researched. This involved evaluating the efficiency, accuracy, and effectiveness of the different approaches.
The findings highlight some of the issues that have broader implications within the field of historic preservation, including the need for the further development of interior research and documentation. The aim of this study is to highlight the call for this form of investigation. In the first chapter, an examination was performed of previous critical and historical works in the field, including both academic writing and professional reports.
This chapter focuses on the lack of available information on the topic and the reasons for the development of such. Chapter two explores the historical background of the Miller Heller House of Ithaca, New York. I examined the importance of the Music Room as it relates to William Henry Miller, owner and architect, and Candace Wheeler, leading 19th century American textile artist and interior designer. Chapter three focuses on the actual documentation process. The Music Room of the Miller Heller House form a case study for the documentation process to be illustrated.

title: Topology and Dynamics of Complex Social Networks
abstract: The problem of modeling complex social networks is considered from three perspectives: The problem of describing network topology; the problem of modeling dynamic processes on networks; and the problem of network sampling. These perspectives are highly complementary, each providing results with applications to one other. With respect to network topology, two main results are presented: An algorithm is presented capable of combining two measures of network structure, the degree distribution and the clustering coefficient. It is found that just two mechanisms are required to achieve any desired combination of these metrics-- network growth, combined with preferential attachment. Secondly, a mathematical model of one class of complex network, semi-random networks, is presented which is capable of elucidating the structure of semi-random networks in greater detail then had been achieved with previous models. Among other results, this theory allows one to calculate the expected number of neighbors at a given distance from a randomly chosen node, and to compute the mean path length inside the giant component. Network dynamics are investigated with a simple epidemic model, the SIR (Susceptible Infected Removed) model. A mathematical theory is presented for predicting epidemic incidence for SIR dynamics in semi-random networks. Finally,

the problem of network sampling is considered. A probability based estimation theory is presented for Respondent Driven Sampling (RDS). The theory enhances RDS by offering greater analytical tractability, analytical variance estimation, and the estimation of means of continuous variables.

title: The Interface Response Function and Melting Point of the Prism Interface of Hexagonal Ice using a Fluctuating Charge Model (TIP4P-FQ)
abstract: Molecular Dynamics simulations have been used to follow the rate of growth and recession of the prismatic surface of a hexagonal ice-water interface. The fluctuating charge, four-site transferable intermolecular potential model, TIP4P-FQ, was used at temperatures between 265 K and 310 K in a series of isobaric isothermal (NPT) Molecular Dynamics simulations. Using appropriate order parameters, an interface response function that captures the speed of the moving interface as a function of temperature was constructed that covers the melting and growth of hexagonal ice. From the interface response function (Tv=0), the melting temperature was found to be within 8 K of 303 K and the maximum crystallization velocity was estimated to be ~1 m/s at 260 K (14% undercooling; in line with the kinetics of other systems such as Si). Changing the Lennard-Jones sigma parameter from 3.159 angstroms to 3.173 angstroms, in line with a previous parameterization by Rick, confirms results from Gibbs-Duhem integration that predicted a reduction in the melting temperature to 276 K. While this value corresponds well with experiments, given the relative simplicity of the model, it comes at the expense of accurately predicting the properties of liquid water. Crystallization from the prism interface involves at least two layers, as determined by density and dipole analysis and is in line with results found from previous TIP6P results.

title: Moving Historic Buildings: One Means of Preservation
abstract: One means by which to preserve a historic building is to relocate it to a new site. There are costs and risks (both financial and material) inherent in such an undertaking. It is likely to be an expensive project. There is a chance that the fabric of the building will be damaged, and the context in which the structure existed historically will change. Careful planning will be necessary in order facilitate transport, and appropriate preparations will be required at both the old and new locations. Clearly, the decision to move a building is one which should not be made haphazardly. Despite the fact that preservationists generally eschew the practice, however, moving a building may in fact be an effective way to preserve a threatened structure. Relocation may enhance or even spare a valuable historic resource, thus extending its utilitarian, economic, aesthetic and historic benefits.
The practice of moving buildings is not new. Numerous examples are presented, thus illustrating what types of structures have been relocated, and chronicling changes in the technology associated with structural moving. Early examples point to primarily practical and financial motives for moving. The growth of the historic preservation movement increased public awareness of the aesthetic and cultural values associated with those aging, dwindling assets. Perspectives on the relocation of historic buildings were influenced by the passage of the National Historic Preservation Act. The resulting guidelines for inclusion of moved buildings in the National Register of Historic Places and limited federal requirements for protection of historic resources are summarized for the reader.
To assist readers who are contemplating the relocation of a building, the various components of such a

project are introduced. Before deciding to move a building, it is advisable to assess its present condition and historic significance, to investigate potential sites, to gain an understanding of the moving process itself, and to estimate the associated costs. Careful planning is essential for successful execution of the project. Numerous professionals can contribute expertise in the process, including architects and engineers, contractors, professional building movers, financial officers, and government officials.

One venue in which moved buildings are often displayed is the outdoor museum. Such facilities offer educational and recreational opportunities, allowing visitors to experience aspects of life in some previous time. Background information is provided for three prominent examples: Greenfield Village in Michigan, the Farmers' Museum in New York, and Hopewell Furnace in Pennsylvania. Consideration is given to the use of preserved (and perhaps moved) buildings, and to the National Register status of each museum.

title: THREE PROBLEMS IN NONLINEAR DYNAMICS WITH 2:1 PARAMETRIC EXCITATION
abstract: Parametric excitation is epitomized by the Mathieu equation, x''+(d + e cos t)x = 0, which involves the characteristic feature of 2:1 resonance. This thesis investigates three generalizations of the Mathieu equation: 1) the effect of combining 2:1 and 1:1 parametric drivers: x''+(d + e cos t + e cos wt)x = 0
2) the effect of combining parametric excitation near a Hopf bifurcation:
x''+ (d + e cos t) x + e Ax' + e(b_1 x^3 + b_2 x'^2 x + b_3 x x'^2 + b_4 x^3) = 0
3) the effect of combining delay with cubic nonlinearity:
x''+(d + e cos t)x + eg x^3 = e b x(t-T)
Chapter 3 examines the first of these systems in the neighborhood of 2:1:1 resonance. The method of multiple time scales is used including terms of O(e^2) with three time scales. By comparing our results with those of a previous work on 2:2:1 resonance, we are able to approximate scaling factors which determine the size of the instability regions as we move from one resonance to another in the d-w plane. @Chapter 4 treats the second system which involves the parametric excitation of a Hopf bifurcation. The slow flow obtained from a perturbation method is investigated analytically and numerically. A wide variety of bifurcations are observed, including pitchforks, saddle-nodes, Hopfs, limit cycle folds, symmetry-breaking, homoclinic and heteroclinic bifurcations. Approximate analytic expressions for bifurcation curves are obtained using a variety of methods, including normal forms. We show that for large positive damping, the origin is stable, whereas for large negative damping, a quasiperiodic behavior occurs. These two steady states are connected by a complicated series of bifurcations which occur as the damping is varied.
Chapter 5 examines the third system listed. Three different types of phenomenon are combined in this system: 2:1 parametric excitation, cubic nonlinearity, and delay. The method of averaging is used to obtain a slow flow which is analyzed for stability and bifurcations. We show that certain combinations of the delay parameters b and T cause the 2:1 instability region in the d-e plane to become significantly smaller, and in some cases to disappear. We also show that the delay term behaves like effective damping, adding dissipation to a conservative system.

title: Mixtures of Exponential Distributions to Describe the Distribution of Poisson Means in Estimating the Number of Unobserved Classes
abstract: In many fields of study scientists are interested in estimating the number of unobserved classes.

A biologist may want to find the number of rare species of an animal population in order to conserve, manage, and monitor biodiversity; a library manager may want to know how many non-circulating items are present in a library system; or a clinical investigator may want to determine the number of unseen disease occurrences. A traditional way of estimating an unknown number of classes is by using a negative binomial model (Fisher, Corbet, and Williams 1943). The negative binomial model is based on assuming that the numbers of individuals from each class are independent Poisson samples, and that the means of these Poisson random variables follow a Gamma distribution. This thesis proposes a parametric model where the law of the mean frequency of classes is a finite mixture of exponential distributions. The proposed model has the following advantages: model simplicity, efficient computation using the EM algorithm, and a straightforward interpretation of the fitted model. Also, model assessment by way of a chi-squared goodness of fit procedure can be used, a benefit this parametric model has over other commonly used non-parametric methods.

A main accomplishment of this thesis is providing an efficient computation of maximum likelihood (ML) estimates for the proposed model. Without use of the EM algorithm, finding ML estimates for this model can be difficult and time consuming. The likelihood function is complicated due to high dimensionality and non-identifiability of certain parameters. Within the M step of our algorithm we embed another EM, which can effortlessly maximize the parameters in the finite mixture. We refer to the algorithm as a nested EM. Aitken's acceleration is used to increase speed of the algorithm.

Microbial samples from the coast of Massachusetts Bay near Nahant, Massachusetts are used to demonstrate data analysis using three different numbers of components in the finite mixture of the model described. It is shown that the model produces reasonable estimates and fits the data satisfactorily. This model has recently been premiered in species richness estimation (Hong et al. 2006), and its many advantages show promise for continued use in estimating the number of unobserved classes.

title: Regimes At Work: The Nonproliferation Order And Indian Nuclear Policy
abstract: Peter J. Katzenstein (chair); Mary F. Katzenstein; Dietram Scheufele; Christopher R. WayThis thesis claims that by constituting a certain range of possible identities for countries, the nuclear nonproliferation regime facilitated India's forging of non-weaponized nuclear deterrence and its decision to go 'formally nuclear' in 1998. The regime's definition of the nuclear problem and its categorization of states into Nuclear Weapon States (NWS) and Non-Nuclear Weapon States (NNWS) structured the threat environment facing India. India responded with a deterrence posture that both violated and employed the regime's norms. Its 1974 'Peaceful Nuclear Explosion' for instance, played on the regime's identification of a nuclear test with the possession of weapons, while challenging its attempt to restrict nuclear knowledge. The regime also served as a resource for actors within India who were advocates for the nuclear program. In 1974, domestic and international audiences were reminded of the developmental promise of nuclear power. By the end of the century, the strategic space that India had occupied between the categories of NWS and NNWS was rapidly shrinking. Perceiving a window of opportunity, India resorted once again to nuclear testing in May 1998 in order to move closer to NWS status.

This work investigates the ways in which the nonproliferation regime impacted on India's nuclear policy, with France and South Africa as secondary cases. It situates itself at the intersection of the domestic and the international spheres, while challenging the separation between the two. It focuses on the processes through which international norms constitute national identity, thereby defining national interest and molding national policies. While the project stems from a dissatisfaction with theories of nuclear proliferation, the argument should extend to several issue-areas. By the end of the twentieth century, terrorism had emerged as a threat to rival nuclear peril. The evolution of an international counter-terrorism regime was accelerated. This work

tries to draw out lessons from the career of the nonproliferation regime for the counter-terrorism regime.

title: The Stability of Parametrically Excited Systems: Coexistence and Trigonometrification
abstract: This dissertation addresses questions regarding the stability of two degree of freedom oscillating systems. The systems being discussed fall into three classes.
The first class we discuss has the property that one of the non-linear normal modes (NNM) has a harmonic solution, x(t)=A cos t. For this class, the equation governing the stability of the system will be a second order differential equation with parametric excitation. Mathieu's equation (1), or more generally Ince's equation (2), are standard examples of such systems.
x'' + (d + e*cos t)x = 0 (1)
(1+a*cos t)x''+(b*sin t)x'+(d+c*cos t)x=0 (2)
For Ince's equation we know that the stability portraits have tongues of instability defined by two transition curves. When these two transition curves overlap, the unstable region disappears and we say that the hidden tongue is coexistent. In this thesis we obtain sufficient conditions for coexistence to occur in stability equations of the form
(1+a1*cos t+a2*cos 2t+...+an*cos nt)x''+(b1*sin t+b2*sin 2t+...+bn*sin nt)x'+(d+c1*cos t+c2*cos 2t+...+cn*cos nt)x=0 (3)
Ince's equation has no damping. For the second class of systems, we seek to understand how dissipation affects coexistence. Here the analysis focuses on the behavior of coexistence as damping (mu) is added. Our analysis indicates coexistence is not possible in a damped Ince equation (4).
(1+a*cos t)x''+(mu+b*sin t)x'+(d+c*cos t)x=0 (4)
The previous two classes address systems with a harmonic NNM. The third class of systems treated in this thesis involve two degree of freedom systems that have a periodic NNM, not in general harmonic. To accomplish this we rescale time such that the periodic solution to the NNM is transformed into the form x(tau)=A0+A1 cos(tau). We call this procedure of rescaling time trigonometrification. The power of trigonometrification is that it is exact, requiring no approximations and produces a stability equation in new time (tau) of the form
(1+a1*cos tau+a2*cos 2*tau+...+an*cos n*tau)x''+(b1*sin tau+b2*sin 2*tau+...+bn*sin n*tau)x'+(d+c1*cos tau+c2*cos 2*tau+...+cn*cos n*tau)x=0 (5)
Trigonometrification can be used to study any system property that is invariant under a time transformation.

title: Macroscopic modeling of quantum effects in semiconductor devices
abstract: This dissertation explores the use of macroscopic quantum hydrodynamic (QHD) models as tools for investigating the transport of charge carriers in semiconductor devices in the regime where quantum effects are important.
Chapter 1 provides a panoramic view of the field of carrier transport modeling in semiconductors. The essential differences between classical and quantum transport is brought out and a brief outline is given of the derivation of successively less detailed models from the fundamental starting points of the Boltzmann

transport equation (BTE) for classical transport and the quantum distribution function (Wigner function, density matrix) based methods for quantum transport. A mention is made of the various quantum hydrodynamic models without going into the details of their derivation and applicability.

Chapter 2 brings into focus the area of quantum hydrodynamic modeling of carrier transport. A detailed derivation using the method of moments is presented for each of the popular quantum hydrodynamic models currently being explored in the literature, namely the density-gradient method and the smooth quantum potential model. A summary is made of their limitations and these limitations are then shown as arising out of particular assumptions made in their derivations that could hamper their applicable regimes.

Chapter 3 presents an analysis of the boundary layers near interfaces obtained in density-gradient theory. An integral equation for the density near such interfaces is obtained and this is used to analytically compare the DG solution with the solutions from one-electron quantum mechanics in non-degenerate conditions. Confinement in simple potential wells is then discussed using the macroscopic equations.

Chapter 4 discusses the derivation of macroscopic equations to describe quantum mechanical tunneling through large barrier potentials. Using the approximate solutions of the Schr?dinger equation it is analytically shown that the density profile inside the barrier satisfies a second order differential equation, very similar to the Schr?dinger equation for a carrier at a suitably chosen average energy. Use of this is made to derive a consistent macroscopic treatment of tunneling transport in the insulating barrier.

Chapter 5, the final chapter, summarizes the major contributions of this dissertation and concludes it with several suggestions for future research directions that can stem from this work.

title: An Evaluation of the Sensitivity of U.S. Economic Sectors to Weather
abstract: This thesis is based upon a series of statistical programs written in SAS. The programs can be used to evaluate the economic impacts of future and historical climate/weather regimes for the contiguous United States. Individuals (or corporations) interested in the specifics of these programs should contact the author directly.This study quantifies the impact of weather on eleven two-digit SIC sectors of the U.S. economy ranging from agriculture and construction to retail trade and utilities. Although it is obvious that weather affects the output of most sectors in some way, the magnitudes of these effects are not well known. This research effort estimates the historical sensitivity of production to annual weather variability. In addition to defining what it means for a sector to be sensitive to weather relative to another sector, industry productivity from 1977-2000 was modeled against measures of temperature and precipitation along with more traditional inputs to production like capital, labor and energy consumption. Specifically, sector output is modeled using a transcendental logarithmic production function (TRANSLOG) with measures of regional weather included. In order to estimate the aggregate sensitivity of the U.S. economy to weather, Monte-Carlo simulation of the four measures of weather is employed for each region by randomly drawing from historically observed weather combinations (i.e. temperature and precipitation) to produce distributions of sector-region output variability holding the conventional economic inputs constant.

As expected, the results show that the impact of weather varies from region to region and sector to sector. It is also evident that traditional methods used to model economic production such as the Cobb-Douglas and TRANSLOG specifications are improved statistically with the inclusion of measures of weather as factors of production. Given the available data at the annual level, the econometric results show that in general and across regions, the manufacturing sector is more sensitive to weather (e.g. cooling degree-days) than previously thought. The results also indicate that economic sectors in the Western U.S. are more sensitive to weather than they are in the Midwest and East Coast. It is also reported that as the standard deviation of precipitation changes by 1%, average U.S. transportation and utilities sector output drops between .02% and

.09% (respectively). For context, actual year 2000 output for the utilities sector was over $200 billion and actual transportation output exceeded $300 billion at the national level. Similar data is reported for nine additional sectors and four measures of weather across eight regions of the country. Although small with respect to traditional factors of production, it is shown that U.S. GDP has expanded on average by $20.8 billion ($2004 U.S.) annually with measured, historical weather variability. In contrast to the subjective estimates made by Dutton (2003) indicating that ?one-third of private industry activities are sensitive to weather?, this research finds that only 16.2% of the aggregate U.S. economy is sensitive to weather on an annual basis. Nevertheless, the effects of weather variability on specific sectors, particularly in Western states, is substantial.National Center for Atmospheric Research (NCAR), NOAA, U.S. Weather Research Program (USWRP)

title: Forecasting Natural Gas Prices Using Time Series Models
abstract: The objective of this thesis is to estimate the natural gas component of the All Urban Consumer Price Index (CP-U) using time series forecasting models. Being able to accurately predict future CPI-U values is important because it allows portfolio managers and financial institutions to properly adjust their market positions for inflation prior to the CPIs print. Certain bonds, such as Treasury Inflation Protected Securities (TIPS), are indexed to CPI and accrete in value as the CPI increases. Accurately knowing the print of the CPI prior to its publication allows investors to properly anticipate movements in TIPS.
Data for this thesis were gathered from two sources: daily Henry Hub natural gas spot prices retrieved from Bloomberg and monthly Bureau of Labor Statistic (BLS) data on CPI-U values for natural gas. Each of these data series was tested for unit root processes, seasonality, and cointegration.
Once these two data sets were shown to be non season, cointegrated series, they were run through three models, which were evaluated in terms of fit and performance in and out of sample against one another. The model which proved to have the greatest predictive power was Model 3, in which a distributed lag polynomial was fit to the data and used to create a rolling out of sample regression.

title: Block copolymer derived mesoporous thin films: processing, characterization, and applications
abstract: Prof. Ulrich Wiesner, Prof. Michael O. Thompson, Prof. Jack M. Blakely. The development of diblock copolymers as structure directing agents for phase selective additives to generate thin films is discussed. Different systems ranging from pure organic [(poly(alpha-methyl styrene-block-4-hydroxystyrene) and poly(alpha styrene-block-isoprene) with photoactive crosslinkers] to an organic-inorganic [poly(isoprene-

block-ethylene oxide) with 3-glycidyloxypropyltrimethoxysilane and aluminum-tri-sec-butoxide] to a non-oxide high temperature system [poly(isoprene-block-dimethylamino ethylmethacrylate) with a polyureamethylvinylsilazane additive] are explored. Characterizationis accomplished through a variety of techniques (atomic force microscopy, scanning electron microscopy, grazing incidence small angle x-ray scattering, nuclear magnetic resonance, and Rutherford backscattering) and supplemented by quantitative analysis (radial and bond orientation distribution functions, Voronoi diagrams, and GISAXS simulations). Hybrid organic-inorganic mesoporous monolayer thin films are used as templates to structure silicon at the 30 nm length scale through a transient laser induced melt and capillarity driven pore filling process.

title: SEGREGATION OF A BINARY MIXTURE OF GRANULAR PARTICLES
abstract: Kinetic theory for a binary mixture of slightly inelastic particles, based on Maxwellian velocity distribution with corrections due to high density, is used to predict segregation of a binary mixture with species differing in sizes and material densities. The relative mean species velocities indicates segregation for a mixture uniformly agitated under gravity. Molecular dynamics simulations of elastic hard spheres and physical experiments with inelastic spheres in a cylindrical container vibrated at high normalized acceleration support this prediction. An analysis for a non-uniformly agitated mixture under gravity provides a general criterion for segregation. We establish the validity of equipartition assumption in this problem.

Then, we introduce kinetic theory for mono-disperse disks with a friction model differentiating sticking and sliding collisions and derive a simple way of incorporating friction into theory with effective normal restitution coefficient.

We linearize Revised Enskog Theory for a binary mixture of dsks with small differences in sizes and masses. By solving a boundary value problem of the mixture sheared between two bumpy circular cells, we provide experimenters a concrete way of testing the theory.

We then compare dense Maxwellian theory, from the first problem, with Revised Enskog Theory to see differences and their consequences on the prediction of segregation. In the absence of temperature gradient, with gravity present, they yield similar predictions. However, in the presence of temperature gradient, with gravity absent, they only agree at high volume fractions.

Then, we describe a steady fully-developed flow on a bumpy incline, with a kinetic theory for mono-disperse spheres. We test the theory by attempting to reproduce three features of inclined flows from physical experiments and numerical simulations. On failing this, we describe modifications that may salvage the core of the theory with a few assumptions. A chain theory is introduced as a promising modification.

With the solutions of the chain theory, we predict segregation on an inclined plane using Revised Enskog Theory. Using density profiles for various sizes and material densities in the mixture, we compare its prediction with the prediction based on dense Maxwellian in the first problem and find that the agreement is good.

title: REPRESENTING HISTORY: NEGATIVE HISTORICAL DISCOURSES IN MEXICAN NARRATIVE AFTER TLATELOLCO
abstract: On October 2,1968, preceding the Summer Olympic Games in Mexico City, a peaceful protest was held at the Plaza de las tres culturas in Tlatelolco which ended with the violent intervention of the Mexican

Army. Following the massacre, the state controlled media downplayed the magnitude of the events and instead focused on the upcoming Olympic Games. Thirty-five years after the fact, much of the information regarding the massacre remains classified and the government refuses to admit responsibility for the deaths.

This project examines the literary representations of that history with a particular focus on the creation and manipulation of negative narrative spaces after 1968. Given the absence of a historical representation of Tlatelolco in the PRI constructed national discourse and the dominance of that discourse, the literary works studied in this project aim to represent history in a narrative space inaccessible to it.

In the first chapter I examine Luis Gonzalez de Alba's testimonial Los Dias y los a?os (1971). This work acts as a meta-history of the current articulation of nation as it bears witness to the mechanisms which were responsible for the unarticulation of Tlatelolco we see today.

Chapter 2 looks at Armando Ramirez's Chin chin el teporocho (1972). The novel draws attention to a textual hole in the narrative which mirrors a historical void in the discourse of the nation. It takes a stance against that omission by unequivocally making a silent statement against it. It actively unspeaks an institution which has silenced the student movement. The third chapter examines Jose Emilio Pacheco's Las batallas en el desierto. This novel deconstructs the historical apparatus of the nation and introduces a series of alternative historical models.

The final chapter looks at the films Rojo Amanecer and El Bulto. Both films are a testament to the absence of the history of 1968. Rojo Amanecer is the first film to be released concerning Tlatelolco and it examines the processes by which the massacre occurred and why it has remained silenced for over twenty years. El Bulto raises the question of how to reincorporate that absent history should it become known.Mario Einaudi Center and the Latin American Studies Program at Cornell University

title: TECHNICAL AND ECONOMIC FEASIBILITY OF UPGRADING DAIRY MANURE-DERIVED BIOGAS FOR NATURAL GAS PIPELINE
abstract: The objective of this thesis was to evaluate the current technical and economical feasibility of processing dairy manure-derived biogas to natural gas quality for injection into the natural gas pipeline. Dairy farms across the county and around the world are utilizing anaerobic digestion to treat manure, improve nutrient recovery and generate biogas. Biogas, which consists mainly of methane and carbon dioxide, with smaller amounts of hydrogen sulfide, water vapor and other impurities, can be used in heating and power applications. Biogas can also be used directly as a high BTU value fuel, comparable to natural gas, if processed to remove carbon dioxide, hydrogen sulfide, water vapor and other impurities.

In order to determine the processing requirements necessary to transform dairy manure-derived biogas to natural gas quality, a compositional analysis of biogas was conducted. Using gas chromatography to analyze biogas samples taken from Dairy Development International, located near Homer, NY, it was determined that the methane and carbon dioxide content of the biogas does not vary significantly over a 24 hour period. The data suggests that DDI?s biogas composition is approximately 60% methane and about 40% carbon dioxide, with a hydrogen sulfide content ranging from approximately 1,500 to 3,000 ppm.

In order for biogas to be suitable for the natural gas pipeline, it must go through a two step process. The first step, known as "cleaning", removes hydrogen sulfide and other trace impurities. The second step, ?upgrading?, removes carbon dioxide, which lowers the energy value of the biogas. This thesis contains an overview of processes that can be used to clean and upgrade diary biogas.

In order to determine the economic feasibility of processing dairy biogas to natural gas quality, a present worth analysis was conducted, using the following variables: number of cows on the dairy farm, selling price of processed biogas, interest rate and proximity of biogas producer to the natural gas pipeline. The results of

the economic analysis show that for all farm sizes considered (500, 1,000, 3,000, 5,000 and 10,000 cows), profit is made, as long as the selling price of the processed biogas is high enough. For example, on a relatively small dairy (500 cows), a profit is made if the processed biogas is sold for $12/MBtu or more, given a low interest rate (3%) and no additional pipeline installation. On 1,000 and 3,000 cow dairies, a profit will not be made unless the processed biogas is sold for at least $6.00/MBtu and $4.00/MBtu, respectively, assuming a low interest rate and no pipeline installation. For a 10,000 cow dairy, a profit is made even if 1 mile of pipeline is installed, as long as the selling price of the processed gas is $4.00/MBtu or above and the interest rate is low. The economic analysis presented in this thesis demonstrates the importance of economy of scale in biogas processing projects, but also demonstrates that smaller biogas producers may be able to sell their processed biogas and make a profit if the selling price is high enough.

These initial results are encouraging and future work is warranted for examining the site specific technical and economical feasibility of processing dairy biogas to natural gas quality for the natural gas pipeline on individual farms.

title: THE DIVERSITY OF CONVERGENCE: STATE AUTHORITY, ECONOMIC GOVERNANCE AND THE POLITICS OF SECURITIES FINANCE IN CHINA AND INDIA
abstract: This dissertation explains contrasting patterns of financial reform in China and India. It focuses on ?securitization? ? the structural shift from credit-based finance (banking) to securities-based finance (stocks and bonds) ? as a politically consequential phenomenon in comparative and international political economy.

The analysis revises common theories of the developmental state ? theories derived from Gerschenkron?s emphasis on directed-credit and the state?s role in capital formation ? in light of securitization?s growing global importance in the last twenty years. Contrasting responses to securitization are explained using international and domestic variables including the profile of a country?s exposure to the world economy, the distributional coalition supporting the state and the prevailing structure of property rights.

At a theoretical level, the dissertation highlights the political consequences of securitization for state authority in the economy, arguing that directed-credit; 1) enhanced state discretion in the management of distributional coalitions; 2) facilitated the perpetuity of poorly specified property rights; and 3) mitigated the consequences of the country?s position with respect to external trade and investment.

Empirically, the research presented here demonstrates that China and India responded differently to the process of securitization, contrary to the expectations of globalization theories that identify finance as a domain in which international forces favoring convergence should be strongest. The thesis also shows that, in contrast to the scholarly depiction of China's authoritarian system as superior to India?s democracy in the reform process, in the area of finance, Indian and Chinese reform patterns are mirror images: reform with substantive change in India, reform without substantive change in China.

Finally, most scholars viewed China's massive foreign exchange reserves and world-topping volumes of foreign direct investment as signs of economic strength. This thesis suggests the opposite: that these signs indicate Chinese vulnerability is derived from an ?affliction of abundance.? India, however, made a virtue of its weakness, exploiting the "advantages of adversity." With little foreign direct investment, few exports, and (until recently) scant hard currency reserves, India chose to develop world-class securities markets and a rich tapestry of securities governance institutions in order to better mobilize and direct corporate finance and attract hard currency through foreign portfolio investment.

title: Countering Hegemony Through Synthesis: A Lifetime of Commitment to the Black Community in the Works of Toni Cade Bambara
abstract: I argue that Toni Cade Bambara's entire corpus works to meld the spiritual, artistic, and political as well as the activist and the community. This theme is contained in her essays, short stories, novels, and films, but is best demonstrated in her two novels The Salt Eaters (1980) and Those Bones are Not My Child 1999). The Salt Eaters agonizingly expresses tension between the spiritual, artistic, and political but in the novel this tension goes largely unresolved. Inability to resolve these tensions leads to the protagonist's suicide attempt and political factiousness within the Black community. Though the novel ends with the protagonist's healing, her future, as well as that of the community, is largely left open ended. Those Bones

are Not My Child however resolves many of the tensions presented in The Salt Eaters. Those Bones are Not My Child narrows the boundaries between author and reader, activist and community. The novel, through its focus on actual events also collapses the divide between fiction and nonfiction, calling for the readers to incorporate the issues in the fiction into action in life.
I use four meta-themes as tools to examine the trajectory of Bambara's fiction and nonfiction as it meets the goal of achieving wholeness. These meta-themes are: countering cultural hegemony, accountability, resistance to false binaries, and reconstructing cultural memory.
This thesis makes a contribution to the field of Africana Women's literary criticism because it concerns itself with the complete corpus of Bambara's work. It seeks to look at Bambara as a whole, as a writer with diverse interests, talents, and evolved with time. This thesis situates her work within a framework set out by Bambara herself, one that centers Black women's voice and experiences and thus continues in the tradition she sets forth as a writer activist.

title: The equine neonatal maladjustment syndrome : review and case report
abstract: Senior seminar (D.V.M.)--Cornell University, 1983. Includes bibliographical references (leaves 17-19).From the moment of birth, the normal foal's activity is highly predictable. It will begin rhythmic breathing within 30 seconds and become sternal within 5 minutes. The sucking reflex will be present within 20 minutes, and in approximately one hour, the foal will stand. By 1 1/2 hours post-partum, the foal will have begun suckling from the mare. From this time onward, suckling will occur at regular 30-50 minute intervals. Meconium excretion and micturition are seen within 15 hours post-partum. Given such a defined and familiar routine, the knowledgeable horse owner easily recognized a breakdown in this behavioral pattern during the neonatal period, which is defined here as the first four days of the foal's life. Changes in behavior are seen as nonspecific signs in neonatal disease. It is the practitioner's roler to interpret the clinical signs, provide a diagnosis, formulate a treatment regimen, and offer a prognosis for the foal.

title: Neonatal isoerythrolysis in a Standardbred foal
abstract: Senior seminar (D.V.M.)--Cornell University, 1991. Includes bibliographical references (leaves 14-15).A two-day-old Standardbred filly was examined for progressive lethargy and weakness of eight hours duration. Signs of recumbency, depression, pale mucous membranes, icterus and tachycardia suggested a diagnosis of neonatal isoerythrolysis. Laboratory findings supported this diagnosis, and medical therapy, including blood transfusions, fluids, antibiotics and oxygen therapy resulted in marked clinical improvement. This condition, which is relatively uncommon in horses, can have fatal consequences if not treated early enough. Early recognition and treatment, as in this case, can prevent mortality. Predictive testing and post-partum management can also prevent deaths due to isoerythrolysis. These will be discussed in this report. Dr. Dorothy Ainsworth

title: How to improve chances that your first job will be a positive experience
abstract: Senior seminar (D.V.M.)--Cornell University, 1994. Includes bibliographical references (leaf [12]). In recent years, there has been an increasing concern highlighting the difficulties and strains of becoming a doctor and practicing veterinary medicine. Tuition and other costs increasing astronomically, lingering educational debts, long working hours, modest compensation, and often insensitive employers have all been cited as factors making veterinary medicine a less attractive career than in the past. A survery conducted by John Lofflin in 1991 of Associate Veterinarians, the author of the article, "Unhappy Associates," in the June 1993 issue cited that 66.7% of 216 respondents are no longer with the hospital they initially joined and 72.4% left within two years. Inspired by Dr. Lofflin, I decided to do a study of my own, using the 1992 veterinary medicine graduates of Cornell University as subjects. The goal of this study was to identify factors associated with the apparently increasing level of associate unhappiness.Dr. Saidla

title: A direct method for the determination of the mean orientation-dependent elastic
abstract: A salient manifestation of anisotropy in the mechanical response of polycrystal-line materials is the inhomogeneous partitioning of elastic strains over the aggregate. For bulk samples, the distributions of these intergranular strains are expected to have a strong functional dependence on grain orientations. It is then useful to formulate a mean lattice strain distribution function (LSDF) over the orientation space, which serves to characterize the micromechanical state of the aggregate. Orientation-dependent intergranular stresses may be recovered from the LSDF via a constitutive assumption, such as anisotropic linear elasticity. While the LSDF may be determined directly from simulation data, its experimental determination relies on solving an inverse problem that is similar in character to the fundamental problem of texture analysis. In this paper, a versatile and robust direct method for determining an LSDF from strain pole figures is presented. The effectiveness of this method is demonstrated using synthetic strain pole figures from a model LSDF obtained from the simulated uniaxial deformation of a 1000-crystal aggregate.

title: A Microfluidic Approach to Enzyme Linked Immunosorbent Assays
abstract: The Enzyme-Linked Immunosorbent Assay (ELISA) is a biochemical technique that is useful for diagnosing disease and infection by detecting antigens/antibodies in a sample. Studying assay design is important in designing an optimal and cost-effective assay which comprises short processing times, small reagent consumption, and portability. The primary objective of this study was to design and test a microfluidic chip to produce a rapid ELISA platform.
A microfluidic device integrating six straight channels and six nitrocellulose strips was used as a platform to produce a rapid and semi-qualitative dot ELISA. Typical dot ELISA processing times are on the order of hours, but has been reduced here to 35 minutes. The same six channel microfluidic device with polystyrene strips in place of nitrocellulose strips was explored for its ability to produce a quantitative sandwich ELISA. The device produced indistinguishable results due to high noise levels which are thought to be a result of non-specific binding.

title: Sidney's Strangers: Language, Materiality, and Authenticity in Astrophil and Stella
abstract: An Honors Thesis Submitted to the Department of English. April 2006 Winner of the Abrams Prize for the Best Senior Honors Thesis in English.This thesis examines the exegetical, intellectual-historical, and theoretical implications of a particular feature of Philip Sidney?s late sixteenth-century sonnet sequence Astrophil and Stella: its continual anxiety over authenticity ? a term I use to signal the ability of its fictional speaker (Astrophil) to find a language capable of conveying his internal cognitive and affective states. Throughout Sidney?s sequence, Astrophil attempts to define an authentic lyrical language by both criticizing other poets and asserting a formal agenda for his own texts. His texts, however, continually contradict in practice what is demanded of them in theory so that the sequence shows an underlying pessimism summed up in Sonnet 35?s question: ?What may words say, or what may words not say, / Where Truth itself must speake like Flatterie?? (my emphasis).

This paradox and the pessimism it produces, I argue, can be understood by situating Sidney?s sequence in a rift between two conceptual frameworks for understanding relations between subjectivity, language, and the material world. In one framework (dominant in western medieval Christendom), cognition, language, and material things were seen as ontologically homogenous ? part of the same sublunary, postlapsarian material stratum. But in another framework ? emerging in the sixteenth century and that would become dominant in western European modernity ? human subjects and their languages were seen as detached from the material world. Sidney?s sequence, I suggest, is stuck between these two ideological polarities. It wants to enact an authenticity that would become possible under the conceptual regime of modernity, where language is imbricated in the immaterial cognitive circuitry of sovereign, Cartesian subjects, and where it thus becomes capable of conveying the authenticity attributed to in modern ideologies of the aesthetic. However, Sidney is caught in the conceptual space of an older model of language: one that sees it as something thingly, ontologically homogenous with the material world.

My first chapter introduces "somewhat lengthily" the problem of authenticity in Astrophil and Stella. It develops some of the intellectual-historical horizons I want to situate the sequence in and introduces the main textual feature I want to follow: Sidney?s tendency, in attempting to establish the authenticity of his own poetry, to criticize other poets for their lack of authenticity vis-?-vis a resemblance between their poetic practices and commercial and economic practices. My second chapter both turns to the contemporary critical landscape of early modern studies and provides further elaboration of my positioning of Sidney in the ambiguities of early modern concepts of subjectivity, language, and materiality. After this lengthy prefatory, I move on, in my third chapter, to read Astrophil and Stella, focusing particularly on Sidney's use of the word "strange" a term that particularly points to the rift I want to chart in the sequence. My fourth chapter concludes with a methodological question: how do the points I have made about the difference between modern and early modern ontologies of language, materiality, and subjectivity effect the contemporary critical landscape of early modern literary studies. Particularly, I pursue the question of whether or not a return to formalism and aestheticism (increasingly called for in protest to the dominance of cultural studies in literary interpretation) has a trans-historical exegetical validity. In conclusion, I suggest that the assumptions on which such a return to the literary would stand become deeply problematic outside of the modern era.

title: Compendium of Scottish Silver Volume 1
abstract: A print on demand of these books and articles can be obtained from Cornell Business Services (CBS) Digital Services by sending e-mail to digital@cornell.edu or calling 607.255.2524. In the body of the message include the identifier.uri for the book or article, and ask to be contacted regarding payment.The Compendium of Scottish Silver is a comparatively comprehensive catalog of antique as well as some modern Scottish silver and gold made between 1320ca and 2004 that has appeared in public and private collections, auction sales and antique shops during the past 50-100 years. It represents an attempt to provide a representative view of Scottish silver production over the centuries as reflected in extant examples. Additionally, the catalog is useful in evaluating the relative rarity of various forms (e.g. Scottish cake baskets or dish crosses) as well as the primary craftsmen producing specific forms (e.g. egg-shaped teapots, dolphin-handled creamboats). The catalog contains over 5,100 listings arranged alphabetically by item (e.g. bowls, candlesticks, flatware, etc.) and presented among items, chronologically. Volume 1 contains the alphabetical listings from Baskets-Ink Pots as well as a Guide, a Listing of First Appearances and a Glossary of the terms use in describing the silver as well as its production and decoration. Photographic examples for most categories are also included before each set of listings. Note that Volume 2 is a continuation of the alphabetical categories beginning with “M”. The book should be a helpful resource for collectors, museums, antique dealers, auction houses, as well as historians, genealogists and other researchers.

title: Epitaxial Multiferroic Thin Film Heterostructure of (SrTiO3/NiO)n/MgO For Use as a Future Negative Index Material
abstract: Multiferroic materials are those that exhibit both magnetic polarization and electrical polarization in the same phase. A multiferroic thin film heterostructure consisting of antiferromagnetic NiO and dielectric SrTiO3 is interesting due to the possibility of achieving a negative index of refraction in the far infrared. If the ionic resonance frequency of SrTiO3 (~100cm-1) and the antiferromagnetic resonance of NiO (~36 cm-1) can be shifted to match at some frequency, the composite material should exhibit a negative index of refraction at that frequency. It should be possible to shift the SrTiO3 resonance to lower frequency by lowering the temperature or by doping with Ba and therefore raising the ferroelectric Curie temperature. The NiO antiferromagnetic resonance should shift to higher temperature by applying an external magnetic field or by doping with ions with higher anisotropy, such as Fe or Co. Pressed powder bulk composite samples of NiO/SrTiO3 have been fabricated and used to verify that NiO and SrTiO3 are compatible and non-reacting up to a temperature of 1550?C. FTIR measurements on these bulk samples verify the existence of the ionic and antiferromagnetic resonances of interest. An epitaxial multiferroic composite of (SrTiO3/NiO)n/MgO

has also been fabricated using reactive off-axis rf sputtering with n = 1 or 2. Crystal quality has been verified using x-ray diffraction and ion channeling with Rutherford backscattering. The full width at half max for the SrTiO3 (100) diffraction rocking curve is only 1.3? for the composite with n = 2. Off-axis sputtering is a useful technique because it can be used to achieve a concentration gradient between constituents. This allows for a method of quickly determining the effects of Ba doping in SrTiO3 or Co, Fe doping in NiO. It should be possible to measure the frequency response of these films in the future with FTIR techniques with polarized radiation and/or a synchrotron high intensity source.

title: A DESIGN AND ANALYSIS OF HIGH PERFORMANCE VOLTAGE CONTROLLED OSCILLATORS
abstract: The voltage controlled oscillator (VCO) is one of the most important building blocks in modern communication applications such as microprocessor clock generation, wired and wireless communications, system synchronization, and frequency synthesis. The design of high performance VCOs has been increasingly more important and still is an active research area. Research on VCOs for the past decade has been concentrated in the areas of higher frequency, lower phase noise, low power, low operating voltage, and increased tuning range. However many of these objectives can be only achieved at the expense of some other objectives. This thesis analyzes the design of high performance of inductor-capacitor (LC) tank and ring VCOs. First the basics of both LC and ring VCOs are reviewed. Then through the basics, new LC VCO topologies and circuit tricks are derived and analyzed. The design, simulation, and layout guidelines are also provided. Finally, the circuit techniques used in both regular and quadrature VCOs and simulation results of regular inductor and symmetric inductor designs are compared. Next, the several single-ended and differential ring VCO topologies are reviewed and pros and cons for each type are provided. From the basic topologies, a new ring VCO cell topology is then introduced, along with the bias circuit, output buffers, and divider. A three stage VCO based on the new topology is designed and simulated in both thick-oxide and thin-oxide devices in 65nm CMOS SOI process. The results of thick and thin oxide devices are compared and confirmed the usability of the new ring VCO cell topology. Finally, a conclusion of the design of high performance LC and ring VCOs is drawn and new directions of research are predicted.

title: Mixing and Mapping Metadata to Provide Integrated Access to Digital Library Collections: An Activity Report
abstract: Reports work in progress to implement integrated access to multiple digital collections described with a variety of metadata formats. Using the emerging resource discovery and digital library management system, ENCompass, a team at Cornell University Library experimented with a new discovery system model. The model uses simple, "pidgin" metadata at the collection management level, but combines this simple layer with other metadata for describing specific resources, to enable users to both discover relevant collections and also conduct deep searches. A metadata format tailored for simplicity (Dublin Core) is used alongside other, more complex metadata formats.Paper accepted for presentation at DC-2001, October 24-24, 2001, NII, Tokyo, Japan. title: Settling Characteristics of Sands Contained in Anaerobically Digested Dairy Manures
abstract: Today's dairy producers desire to maximize cow comfort and manage the nutrients in manure in

an environmentally sound manner. Many dairy farmers would like to use sand for bedding in their freestall barns because of the increased comfort it provides for cows. A negative aspect is that sand bedding inherently mixes with manure to form sand-laden dairy (SLD) manure, which has historically been difficult to deal with effectively. Dairy farmers are increasingly using biological digester systems as a means to control odor and to reduce the potential for environmental pollution (Wright et al., 1999; Parsons, 1984). Anaerobic digesters biologically convert or digest wastes and agricultural byproducts in the absence of oxygen into biogas, a combination of methane and carbon dioxide gases over a period of fifteen to twenty days (Parsons, 1984). These systems can experience failure due to the bedding sand collecting as settled material within the digester, with no easy means for removal. Design solutions are needed to address this problem.
The settling rate of sand in manure that was undergoing anaerobic digestion was investigated. A Hindered Settling Equation, based on boundary layer theory, was selected to model the rate that sand settles in dairy manure while being anaerobically digested for 21 days. The change in viscosity and the total volumetric solids content over time were required as inputs to the Hindered Settling Equation. Laboratory scale digesters were used to anaerobically digest SLD manure and to concurrently monitor sand settling characteristics and changes to manure total solids, total volatile solids and viscosity.
A power law was used to mathematically model manure viscosity. Regression equations were developed from the data collected from the laboratory scale experiment to model total solids, total volatile solids, k, n and shear stress over time during the digestion process. These equations had R2 values that ranged from 0.40 ? 0.96. The Hindered Settling Equation using the modeled manure viscosity term was used to then predict two data sets, one from the laboratory scale experiments and the other from a commercial field scale digester that had been in operation for several years. There was no significant difference between model predictions of sand settling times and the two data sets at an alpha level of 0.05.
A program was developed in Microsoft EXCEL, based on the results from this project, to be utilized as a tool for dairy producers and consultants for the design, construction, and management of anaerobic digesters that receive SLD manures.

title: Economic Feasibility Study for a Centralized Digestion System
abstract: An economic feasibility model for centralization of anaerobic digestion of dairy manure mixed

with food waste is developed. The model was converted into a user-friendly, web-based computer program and allows users to input different variables and computes profits or costs of a defined centralized digestion system. Default values are given in the program and can be modified by the user. The model accounts for various costs including: equipment, transportation, manure, labor, insurance and maintenance, and accounts for revenues from tipping fees, sales of electricity, sales of effluent solids and liquid manure, and sales of excess heat. Tipping fees and sales of liquid manure were the major contributors to the overall revenue with 2,000 or more cows in the system. The largest cost was the price of manure followed by labor costs. Sensitivity analyses were performed to determine the total number of cows required for the enterprise to remain profitable and the percent change in profit, when changes in parameter values were made, one-at-a-time. An example model was run for a cluster of farms and three correctional facilities in Malone, NY, and the operation was found to be economically feasible.

title: STRATEGIC HUMAN RESOURCE MANAGEMENT AND FIRM PERFORMANCE: WHAT CAN WE LEARN FROM SMALL BUSINESSES?
abstract: This study develops a theory of how human resource management systems contribute to the performance of small businesses. Based on theories from the field of strategic human resource management and small business performance, I argue that high involvement human resource management systems will be positively related to the performance of small businesses above and beyond known drivers of small business performance. A set of moderating variables for this relationship is also presented. I conclude by outlining a set of hypothesis and methods for testing the relationship between human resource management and performance in small businesses.

title: The cutoff phenomenon for finite Markov Chains
abstract: A card player may ask the following question: how many shuffles are needed to mix up a deck of cards? Mathematically, this question falls in the realm of the quantitative study of the convergence of finite Markov chains. Similar convergence rate questions for finite Markov chains are important in many fields including statistical physics, computer science, biology and more. In this dissertation, we discuss a behavior ---the cutoff phenomenon--- that is known to appear in many models. For these models, after a waiting period, the chain abruptly converges to its stationary distribution.

Our aim is to develop a theory of this phenomenon and to illustrate this theory with interesting examples. We focus on the case when the convergence is measured at the ℓ^p-distance for $1\le p\le\infty$. For $p=1$, one recovers the classical total variation distance.

One of the main result of the thesis is that for families of reversible Markov chains and $1<p\le\infty$, the existence of an ℓ^p-cutoff can be characterized using two parameters: the spectral gap and the mixing time. This fails when $p=1$.

The notion of cutoff for a family of Markov chains indexed by n involves a cutoff time sequence $(t_n)_1^\infty$ and window size sequence $(b_n)_1^\infty$. Ideally, when a cutoff exists, we would like to determine precisely t_n and b_n. When $p=2$, spectral theory allows for a deeper analysis of the cutoff phenomenon producing in some cases the asymptotic behavior of the sequences $(t_n)_1^\infty$ and $(b_n)_1^\infty$.

Throughout the thesis, examples are provided to illustrate the theoretical results. In particular, the last chapter is devoted to the study of the cutoff for the randomized riffle shuffle.

title: AutoSyringe Injection: Mass transfer driven by plunger to force medication through a needle
abstract: The AutoSyringe is an automatic device that allows patients with limited dexterity to administer medication to themselves as painlessly as possible. The device allows patients to inject themselves subcutaneously, where the needle goes into the fat layer between the outer skin and the muscle. In this study, given a constant pressure applied at the plunger, the flow of medication through the barrel and needle of a syringe was modeled in terms of velocity and pressure. Furthermore, through this model it was found that the flow rate at the tip of the needle decreases with increased viscosity of the medication. It was also determined that the flow rate increases with increased applied pressure at the plunger. These analyses were performed using the software package FIDAP, PreSTO, with imported geometry from GAMBIT.

title: Drug-Eluting Stents: Design for Prevention of Angioplastic Restenosis
abstract: Balloon angioplasty and coronary stent deployment are powerful techniques in the treatment of individuals with advanced coronary artery disease. Recent advancements have led to the development of drug-eluting stents designed to release a drug polymer that inhibits restenosis, a bodily defense mechanism characterized by tissue ingrowth and reblockage of the artery. The stent is coated with an anti-cancer or immunosuppressive drug that diffuses through the surrounding tissues over a critical period of time. In this study, diffusion of the drug Rapamycin was modeled using computer-aided design software. Analysis

was performed in order to determine the concentration profile of the drug at various time intervals. The stent geometry was reduced to six concentric rings of 1.5 mm width spaced 1.5 mm apart, resulting in a total stent length of 16.5 mm. Diffusion was modeled from only one of these rings and conclusions were drawn considering the global diffusion from multiple rings of this type. A graded mesh was generated in GAMBIT, and simulations were executed in FIDAP to assess the drug concentration as a function of several input parameters. It was concluded that the drug reaches 48 ?g/m3, within a defined therapeutic concentration range of 40-60 ?g/m3, after about nine months at a penetration depth of 0.015 mm. This indicates that after nine months the first tissue layer surrounding the coronary lumen, also known as the intima, is saturated with drug at concentrations necessary for the prevention of restenosis. Sensitivity analysis was performed to test the stability of our solution and to assess factors which may affect the diffusion process. It was found that the concentration of Rapamycin was most sensitive to a change in diffusivity of Rapamycin in the intimal tissue layer, whereas the drug concentration was less sensitive to changes in the stent diffusivity and variance in initial concentration of drug immobilized in the stent.

title: Laser Interstitial Thermo-Therapy in Hepatic Tissue
abstract: Laser Interstitial ThermoTherapy (LITT) is a well establish surgical method used in the treatment of tumors. This study analyzes the extent of tissue damage when using LITT in a liver. GAMBIT and FIDAP was used to model a spherical tumor with a diameter of 4cm in a 12cm spherical liver. The mesh that was used contained 14326 nodes which were shown to converge using our mesh convergence analysis. From our sensitivity analysis, the optimal time the laser would be on was determined to be 40 seconds, because this was the time where most of the cancerous tissue was destroyed while keeping healthy tissue damage at a minimum. The optimal laser power was determined to be 30W, which provided the correct amount of heating needed to induce necrosis in the most of the tumor, and maintain a safe temperature below 40oC for healthy liver tissue. However, there a small amount of healthy liver was destroyed, but this could not be avoided due to the cylindrical geometry of the laser applicator. In our sensitivity analysis, we determined that varying the thermal conductivity caused very little change in the average tumor temperature. This indicates that thermal conductivity parameter is relatively insensitive to changes and using our values for thermal conductivity would accurately model the process.

title: Angina Patch: Drug Delivery for Chest Pain
abstract: Angina pectoris is defined as chest pain due to lack of blood and oxygen to the heart. Nitroglycerin is an organic nitrate which treats angina by vasodilating both arteries and veins to increase blood flow to the heart. It is easy to develop nitroglycerin drug tolerance, and therefore drug application must occur at intervals of about 12 hours.
While commercial products such as Deponit are suitable for treating mild cases of angina, a larger, daily dose of 40 mg of nitroglycerin is needed to treat the most acute cases. The purpose of this study is to model the diffusion of nitroglycerin from a transdermal patch into the blood stream using the Deponit drug delivery system. We determined that Deponit was indeed unable to deliver the necessary 40 mg of drug. We therefore suggested a new patch which could treat acute angina, by modifying both patch geometry and the initial amount of drug in the reservoir. We also simulated drug delivery for a 36 hour period of wearing the patch

for 12 hours, not wearing the patch for 12 hours, and then reapplying a new patch for another 12 hours. We found that drug continued to be delivered even in absence of patch and after 36 hours, only ~125 mg of drug was delivered. The modified Thicker Patch with a 10x thicker drug reservoir than Deponit can physically hold 142 mg of drug and deliver 40 mg within 12 hours. The modified patch is safe, non-toxic, cost effective, and capable of treating recalcitrant angina. To determine whether our assumptions were appropriate for our parameters, we performed two specific sensitivity analyses: varying the diffusivity of the skin and varying the diffusivity of the patch and the skin. From the sensitivity analysis we found that the amount of drug delivered to body is very sensitive to the diffusivity of the skin but insensitive to the diffusivity of the patch

title: The Advantage of Under Armour for Winter Sports Performance
abstract: Under Armour produces apparel designed for winter sports athletes. This apparel aims to keep athletes comfortable by retaining body heat and removing moisture due to perspiration. Special wicking properties are claimed to enable the material to remove moisture quickly and provide insulation. This study will propose a mechanism by which the Under Armour clothing material achieves these effects. We will model moisture transfer and heat transfer through the cloth, considering skin surface temperature and moisture content as measures of comfort. Additionally, we will compare the effects of Under Armour to cotton clothing which has different material properties, considering diffusivity, conductivity, partition coefficient, and porosity. The goal of this study is to use our proposed model to show the advantages of Under Armour for winter sports performance.

title: Ex Vivo Maintenance of Heart Viability: Comparison of Two Methods
abstract: Currently established methods of tissue preservation for heart transplantation involve placing the harvested donor heart in a cold, nutrient-rich cardioplegic solution. Clinically, methods like these have only been shown to preserve heart tissue for a matter of hours. A new solution for tissue preservation developed by Transmedics Inc involves placing the heart in a chamber that mimics the physiological conditions of the human chest cavity. This solution maintains the heart in a beating state and pumps blood and nutrients through the myocardial circulation. This preservation technique has been clinically shown to improve the length of time that a heart can be preserved ex-vivo and when properly implemented, could theoretically preserve a donor heart indefinitely.
A computer simulation using Finite-Element analysis was performed with the intention of comparing how well these two methods work to perfuse heart tissue with oxygen over a long period of time. As expected, it was shown that the Transmedics cart could keep the concentration of oxygen in the heart tissue at optimal levels indefinitely while the immersion technique could only keep the concentrations of oxygen in the tissue above healthy levels for around 5.5 hours. Investigations into the effect of temperature on each preservation technique found that the Transmedics preservation is most effective at 37 degrees Celsius, body temperature; while the immersion technique is most effective at 4 degrees Celsius. Though the Transmedics device was shown to be far superior in many areas, other considerations, like the cost and the ease of implementation of each technique have lead us to conclude that there are still certain situations in which tissue preservation by cooling is the best option for heart transplantation.

title: Heat Loss in the Carotid Artery During Selective Brain Cooling in Humans
abstract: Heat flow in the neck was simulated in FLUENT to study countercurrent effects of cooling blood in the carotid artery during selective brain cooling. The simulation was performed in order to verify Zhu?s theory (used as a basis for our methodology) and to determine the contribution of countercurrent exchange by comparing results to a heat flow model without exchange. The surface temperature of the neck and flow rates within the vessels were varied to determine the specific effects of countercurrent exchange. With ambient skin temperature (25?C) and normal blood flow rate (120 ml/min); our model demonstrates that the average temperature of the arterial blood reaching the brain drops by 1.18?C while traveling through the neck. The effect of the countercurrent exchange alone contributes 0.88?C to this temperature decay. Placing an ice pack on the neck surface can further decrease the arterial blood temperature by as much as 1.0?C. This indicates that placing an ice pack on the neck does aid in selective brain cooling and that countercurrent exchange has a significant impact in cooling as well. The overall temperature drop of blood between the inlet to the carotid artery and the outlet was found to decrease with increasing blood flow rates and surface temperatures, verifying the trends modeled in Zhu?s analysis. Zhu?s theoretical study, however showed a temperature drop of 0.35?C at a blood flow rate of 240 ml/min with vein inlet blood temperature at 29?C and neck temperature at 19?C whereas ours showed a temperature drop above 0.85?C. Sensitivity analysis was performed to test the stability of our solution and to discover factors that might affect arterial outlet temperature. The factors that had the most influence on penetration depth were the specific heat of the blood and varying the thermal conductivity of the tissue. This project could be expanded upon by considering more variations in geometry, such as center-to center spacing, vessel eccentricity and modeling multiple vessels. This would allow for a better model of the true behavior of heat flow in the neck.

title: An Analysis of the Ortho Evra Birth Control Patch
abstract: The Ortho Evra Birth Control Patch is an effective alternative method of birth control. It releases two drugs, norelgestromin and ethinyl estradiol, and these two drugs diffuse through a person?s skin and into their bloodstream. In order to analyze this process, we developed a 2-D, axisymmetric model of the diffusion of norelgestromin from the patch and through the skin. Through the use of a sensitivity analysis to determine the correct patch diffusivity, we were able to get an accurate representation of the physical process. We then modeled what would happen if the patch were removed for various periods of time, and we were able to determine that if the patch were removed for 24 hours or less, no significant disruption to the delivery of the drugs would occur. Finally, we also ran a simulation of wearing two different patches over the course of two weeks, and we determined that the concentration would normally encounter periodic rises and falls over the two-week period.

title: Cold Therapy of Sporting Injury in Upper Thigh Region: A Comprehensive Study on the Time Required to Achieve Optimal Cooling and the Effects of Swelling

abstract: One of the most common injuries amongst athletes is soft tissue injury due to impact, and the traditional treatment for this is cold therapy using an ice pack. While this treatment is effective, inexpensive, and easily accessible, there is very little quantitative data available on the actual effects of ice on the muscle. The most common advice found in medical textbooks and literature is a 20 minute on, 20 minute off icing cycle. In this study we model the temperature distribution in the upper leg region after one and a half cycles of ice therapy. Our axisymmetric model consists of three layers: skin, fat, and muscle, and we include an initial swelling of the muscle layer that decreases as a function of the muscle temperature. After an initial 20 minutes of cooling, the desired temperature change of 10?C penetrated to only 4 mm into the muscle layer, but after a 60 minute cycle, the desired cooling increased to 1 cm. Our sensitivity analysis revealed that slight changes in properties such as density, specific heat and conductivity did not alter the results significantly. Also, using a fixed muscle thickness independent of temperature yielded a lower temperature drop in the muscle layer. It was concluded that ice therapy, though slow, is effective in cooling some of the muscle to the desired temperature, and its main advantages stem from its inexpensiveness and ease of application.

title: Hormone Delivery System: The Contraceptive Ring
abstract: Many women use contraceptive methods that involve the hormones estrogen and progestin, which prevent the ovaries from developing and releasing mature eggs. This, therefore, prevents conception. Currently there are two well established types of birth control on the market. These possibilities are the pill form where the user ingests a large dose once a day for 21 days or the birth control patch is placed on the skin every week for three weeks out of the month. Women can also receive hormone shots or implants that last for four months. However, these methods only allow a menstrual cycle every four months, so they are difficult to compare to the other methods. All of these other methods can cause side effects such as headaches, blood clots, nausea, and breakthrough bleeding. However, there is a new form of birth control that comes in a flexible thin ring that is inserted into the vagina below the cervix. This ring is designed to releases a continuous low dose of hormone that is absorbed by the vagina and distributed into the blood stream. The ring actually releases two derivatives of estrogen and progestin known as etonogestrel and ethinyl estradiol (Organon USA Inc. 2005). See Figure 1 for the chemical structures of both of these compounds. Because the ring is only changed once a month, it ceases the fluctuation of hormone levels that is normal in the other birth control methods.

title: The Effect of a Cooler on the Rate of Heat Loss from a Horse Post-Exercise
abstract: Coolers are large wool blankets put on horses after exercising or bathing during cold weather. They are intended to allow moisture to travel away from the body of the horse while providing an insulating layer to help stabilize their body temperature and to prevent them from getting a chill. We tested the effectiveness of these wool coolers by comparing the rate of heat loss from a horse's skin with and without the added wool layer. Using the modeling software of FIDAP we were able to simulate the coupled processes of heat transfer from the horse?s skin and sweat evaporation.

The model was run in FIDAP after determining an optimized mesh size and time step, which allowed accurate finite element modeling but maintained a reasonable run time. The model shows that the wool helps maintain a constant body temperature post exercise by providing an insulating layer.

Since accurate diffusivity and conductivity values for wool and hair were hard to find, a sensitivity analysis was performed to determine the effect of an error on the temperature and mass profiles. After varying the diffusivities by one order of magnitude and the conductivities by 10%, the model determined that errors in these variables have little to no effect on horse body temperature approximations after one half hour.

title: Heating of Nanoshells by Near-infrared Radiation: A Rapid and Minimally-invasive method for destroying tumors
abstract: The purpose of this project is to model a novel and promising cancer treatment that involves the destruction of tumor cells by the direct injection of biocompatible nanoparticles (gold-silicon nanoshells) and their subsequent heating with near-infrared radiation. The use of near infra-red radiation gives this procedure an advantage over other thermal ablation treatments for cancer since light at this range (700-900 nm) is not significantly absorbed by chromopores in human tissue and can therefore penetrate more deeply (Hirsch et al., 2003). The method is also quick and minimally invasive. Using the simulation software FIDAP, we analyzed the diffusion of the nanoshells into a spherical tumor after being injected into its center. The change in temperature of the tumor due to the exposure of the nanoshells to near-infrared light was also studied. We found out that when 50 microliters of nanoshell solution (concentration of 1.5 e10 nanoshells/ml) is introduced to a 1-cm diameter tumor, it takes 29 hours for the nanoshells to fill up the tumor. At this point, exposure of the tumor with a laser (800 nm, power = 5.6 W/m2) for 10 min raised the temperature of the entire tumor to at least 45?C, effectively destroying it. Further analysis on the effect of nanoshell distribution on the temperatures obtained showed that it has negligible effect. All distributions tested (0%, 25%, 50%, 75% and 100%) resulted in the entire tumor being heated above 45?C. The laser can therefore be immediately applied to the tumor right after injection. Nanoshell concentration vs. time and temperature vs. time profiles for the tumor for various treatment conditions were also obtained. The results of the mathematical modeling will help further studies of this treatment. Although the method still needs to be refined, it should provide an effective new treatment for the destruction of breast carcinomas and other localized tumors.

title: The Newsletter of the Department of Chemistry and Chemical Biology at Cornell University Number

1, March 1968Cornell University Department of Chemistry Newsletter Number 1, March 1968
abstract: This brief newsletter will have many purposes, the main one being to be informative and useful. One purpose it will not have is to be a fund-raising instrument. Many people have approached me and others in the Department about setting up some kind of an informal group or association of people who have been associated with the Cornell Chemistry Department. To start things off, I thought that we would put out a newsletter which would be published infrequently - maybe twice a year.

title: The Newsletter of the Department of Chemistry and Chemical Biology at Cornell University Number 4, August 1969Cornell University Department of Chemistry Newsletter Number 4, August 1969
abstract: As you know, much has occurred since the last issue of the Newsletter. I do not want to go into the happenings of April here since I don't think this is an appropriate place and also many of you have already received much information about the events at Cornell. The one interesting thing to me was the quality (and often lack of it) of the news reporting. Some beneficial results of the happenings are that, within this Department, there have been better communications and a better understanding of the concerns of members of the Department. Over the summer, we have been examining in depth the role of the chemist in the modern-day world. Discussions on such current problems as pollution, the race problem, chemical-biological warfare, research funding and the population problem have been held.

title: The Newsletter of the Department of Chemistry and Chemical Biology at Cornell University Number 5, February 1970Cornell University Department of Chemistry Newsletter Number 5, February 1970

abstract: In planning this issue of the Newsletter, I looked back at last August's issue. I started off by saying that "much has occurred since the last issue of the Newsletter". These words again are very appropriate. I am sure you all know that Dale R. Corson was elected as the eighth president of Cornell by the Trustees soon after the Newsletter went out last August. President Corson had served as Provost of the University for a number of years before assuming the presidency. President Corson then called on Bob Plane, Chairman of the Chemistry Department, to serve as Provost. Bob decided to take the job as Acting Provost on a one-year basis. Because Bob would only be gone temporarily, it was decided to operate the Department with what I call a "troika". Instead of having a specific person as acting chairman, three people served in this capacity. These people were Don Cooke, Jerry Meinwald and Ben Widom. Just after Christmas, Bob Plane announced that he had decided to take the Provost's job on a permanent basis. This means that he will still be Professor of Chemistry and maintain a research group; but will be spending virtually full-time as Provost which, in effect, is second-in-command of the University. This is a considerable loss to the Department; but a gain for the University and we are very confident that Bob will do an excellent job. Upon assuming the permanent position of Provost, Bob Plane resigned as Chairman of the Chemistry Department. As you can tell from the Chairman's Column, the new Chairman of the Department is Gordon Hammes.

abstract: One often hears and reads about the decreased interest in science among the young people of today. If that is true, we certainly are not seeing it in the Chemistry Department at Cornell. While the number of chemistry majors graduating each year has While the number of chemistry majors graduating each year has graduate enrollment in chemistry courses has increased dramatically this year. It is true that Cornell took in an additional 250 (approximately) students; however, even taking this into account the percentage of all students taking chemistry has increased. This past fall there were 270 more people taking freshman chemistry alone.

title: Lecture Notes on Fracture Mechanics
abstract: This book is written for students who want to prepare to be able to read some of this vast literature and to apply it in engineering practice.
Here the emphasis is on mechanics models for crack tip fields and energy flows with discussion of how these results affect observed fracture behavior.
A brief discussion of computational fracture methods is given along with additional practical aspects such as fracture toughness testing and fracture criteria. A student who has worked through the notes should be able to read and understand research articles or monographs on advanced aspects of fracture and should be able to apply this knowledge to real-world problems.
As I intend to update the notes, I would be happy to take any suggestions or corrections and am open to collaboration to expand the coverage.

title: The Supreme Fiction: Fiction or Fact? Two Notes on Wallace Stevens and Philosophy
abstract: The thesis presents two reflections on what it might mean to read Wallace Stevens philosophically. The first section argues that we would be better off avoiding the search for a supreme fiction in Stevens' poetry. By the poet's own standards, he never succeeded in creating one. The second section attempts to justify the abandonment of the search for the supreme fiction by suggesting another, perhaps more productive way in which Stevens' poetry might be philosophically read. In particular, it will be argued that what Helen Vendler calls Stevens' "qualified assertions" can be seen as a potent technique for the avoidance of philosophical dogmatism.

title: Reading Jacob's Room as a Transmission of Shocks
abstract: An Honors Thesis Submitted to the Department of English, Cornell University, April 2006. Winner of the Abrams Prize for the Best Senior Honors Thesis in English.This thesis examines Virginia Woolf?s 1923 novel Jacob?s Room as a transmission of what Woolf in her unfinished memoir refers to as ?shocks.? In A Sketch of the Past, Woolf describes the experience of these shocks and her immediate desire to explain them, presenting writing as a reparative activity that imparts meaning to the apparently senseless and alleviates pain by creating wholeness out of fragmentation. She illustrates this concept by providing three examples from her own childhood, each of which offers a very different model of experience. In this thesis I relate these shocks to the structure of Jacob?s Room and a number of strangely digressive and open-ended passages within it, proposing that the novel actually resists Woolf's own model of reparative writing and does not process shocks into wholes for the reader so much as transmit them to her.

abstract: For those of you who have not been here for some time, here are some data that might be interesting. For example, 3400 students in the Fall of 1971 and 2800 students in the Spring of 1972 were registered for courses offered by the Department of Chemistry. The faculty, responsible for this staggering formal teaching load, managed to conduct research resulting in 184 publications this past year. This was in addition to dozens of invited seminars, etc. Recognition of distinguished achievements in original research came to Lynn Hoard and Roald Hoffman when they were elected to the National Academy of Sciences this Spring. This high honor, bringing honors to Cornell as well as the recipients, is now enjoyed by five members of the Department's faculty.

abstract: One of the great things that has happened to the department this year is the renovation of the undergraduate teaching laboratories in Baker Lab... Now the basement has one area for the preparation of reagents and storage of chemicals used in each of the 5-6 laboratory courses taught in this East side of Baker. Also, in the basement is the Electronics Shop and storage of instruments such as balances, spectrometers, meters, etc. A service elevator has been installed connecting all five floors. The old, open lab areas on each of the remaining four floors has been partitioned into a service area and 5 laboratory modules per floor. Each of these modules will hold 20-22 students.

title: Cornell: Glorious to View
abstract: Selections available for preview as PDFs. Hardcover available for purchase at the Cornell Store: http://www.booksite.com/texis/scripts/oop/click_ord/showdetail.html?sid=3635&isbn=093599503X&music=&buyable=0&assoc_id=&spring=The steep hills and dramatic gorges of Ithaca were the setting for a revolution in American education when, in the 1860s, a self-made man sought "to do the most good . . . to the poor and to posterity." Ezra Cornell's philanthropy, enhanced with funds from the Morrill Land Grant Act and enlarged by the vision of educator Andrew Dickson White, created what has been called the first American university - a modern, democratic, research-oriented institution open to young men and women of all creeds and races. Reflecting the ideas of its founders, Cornell University has combined the industrial science and technology of America with the humanism of Athens to serve both the individual and society.

In her concise, generously illustrated account of Cornell, Carol Kammen places that bold vision in its nineteenth-century context - a time when higher education was restricted to a privileged few. Now the university enters the twenty-first century as an institution of international stature and a leader in educational opportunity.

Kammen, a noted local historian and lecturer in history at Cornell, tells the story of this great university with verve. Highlighting the text are excerpts from important documents and images from archives in the Cornell Library's Division of Rare and Manuscript Collections, selected by Susette Newberry, a Cornell archivist specializing in photography and media studies. Together, words and images illustrate the growth of the university, the origins of its famous schools and colleges, and its enduring commitment to excellence in education.

About the Author Carol Kammen is Senior Lecturer in History at Cornell University. She is the author of several books, including Plain as a Pipestem: Essays about Local History and Lives Passed: Biographical Sketches from Central New York. She is also editor of The Pursuit of Local History and coeditor of The Encyclopedia of Local History. Walter LaFeber is Marie Underhill Noll Professor of American History at Cornell University, where he has taught since 1959. His many books include The New Empire: An Interpretation of American Expansion, 1860-1898 (also from Cornell), Michael Jordan and the New Global Capitalism, and

The Clash: U.S. Relations with Japan from the 1850s to the Present.

title: Distributed Wave Field Synthesis
abstract: Many problems in geophysics, acoustics, elasticity theory, cancer treatment, food process control and electrodynamics involve study of wave field synthesis in some form or another. In the present work, the modeling of wave propagation phenomena is studied as a static problem, using Finite Element Methods and treating time as an additional spatial dimension. In particular wave field synthesis problems are analyzed using discrete methods. It is shown that a fully finite element based scheme is a very natural and effective method for the solution of such problems. Distributed wave field synthesis in the context of two-dimensional problems is outlined and incorporation of any geometric or material non-linearities is shown to be straightforward. This has significant implications for problems in geophysics or biological media where material inhomogeneities are quite prevalent. Numerical results are presented for several problems referring to media with material inhomogeneities and predefined absorption profiles. The method can be extended to three dimensional problems involving anisotropic medium properties in a relatively straightforward manner.

title: The influence of moderate and high formula docosahexaenoic acid on term baboon neonate tissue composition and clinical parameters
abstract: Long-chain polyunsaturated fatty acids (LCPUFA) are indispensable for normal infant growth and development. Docosahexaenoic acid (DHA, 22:6n-3) and arachidonic acid (ARA, 20:4n-6) are LCPUFA that play a critical role in central nervous system development. During the brain growth spurt, rapid accumulation of LCPUFA occurs in the brain and retina. Currently, insufficient evidence exists to determine optimal levels of dietary LCPUFA required during the perinatal period.

In the context of a safety and efficacy study of dietary LCPUFA in baboon neonates, we examined the influence of medium and high levels of formula DHA levels on tissue fatty acid composition and hematological and clinical chemistry measures. Infant formulas were fed from birth to 12 weeks of age: Control (C, no DHA/ARA); 1? LCPUFA (L, 0.32%DHA/0.64%ARA); 3? LCPUFA (L3, 0.96%DHA/0.64%ARA).

At 12 weeks, tissue DHA levels were more sensitive to dietary manipulations than ARA. While DHA in the cerebral cortex increased with higher concentrations of DHA, no differences between L and L3 were detected in the basal ganglia and limbic system. These findings indicate that current levels of LCPUFA in infant formula are not sufficient to optimize DHA levels in the developing cortex. RBC, hematocrit, hemoglobin, and red blood cell distribution width (RDW) were significantly elevated by formula DHA and ARA. All erythrocyte values were within accepted normal ranges for infant baboons and no differences were detectable at 12 weeks. These data provide the first indication that dietary LCPUFA may influence hematopoiesis during the first weeks of life and mitigate the precipitous decline in red cell values associated with neonatal anemia.

All clinical chemistry parameters were normal up to 12 weeks of age. Many of the trends observed were similar to those documented in human infant development. No negative effects on growth measures, hematological or clinical assessments were observed between formula groups. These results suggest that levels of DHA higher than presently included in US infant formulas enhance cerebral cortex DHA and may provide additional benefits by improving erythropoiesis. They also provide a basis for interpretation of parallel human infant studies currently underway.

title: Volumetric Deformation: A New Objective Measure to Study Chair Comfort Using 3D Body Scanning Technology
abstract: Proper lumbar support is a necessary and fundamental requirement for any well-designed chair. Objective techniques to assess chair comfort necessitate the use of a sensing layer that may change the fundamental characteristics of the chair itself depending on its structure and materials. Other methods have attached equipment to subjects, which may influence their normal sitting behavior. In this study, I utilize new 3D body scanning technology to examine the person-chair interaction in flexible, material back chairs

without adding anything to either the chair or the subject. I attempt to develop a new objective measure, volumetric deformation, which assesses the reaction of a flexible, material chair back to a seated user. In addition, this study aims to understand the relationships between perceived chair back comfort, objective volumetric deformation, subject anthropometric attributes, and ratings of perceived chair attribute comfort. Total chair back deformation is found to be significantly related to some subject anthropometric attributes, which provides further evidence that deformation is a useful objective measure for assessment of the chair back. Perceived overall back comfort is significantly associated to the perceived comfort of the lumbar support but not to any of the anthropometric measurements taken. The relationship between chair back deformation and pressure distribution should be explored in future studies.Professor Alan Hedge, Faculty Advisor

abstract: This presentation was originally presented as part of the 2005 Cornell Nanoscale Facility Fall Workshop, "Modeling the Nanoscale World". An overview of multiple scattering theory and how it relates to electronic structure in materials is provided. In addition, different approaches based on this theory such as the Korringa Kohn Rostoker (KKR) technique and the linear muffin-tin orbital approach (LMTO) are described. Finally an overview of Green's function techniques related to nanoscale transport is also provided. The Cornell Nanoscale Facility is part of the National Nanotechnology Infrastructure Network (NNIN). The NNIN is made possible through funding from the National Science Foundation.

title: Migrating Commonspot Sites
abstract: Microsoft Powerpoint presentation, 12 slidesThis presentation, given at the Cornell Commonspot

SIG meeting on March 22, 2006, addresses issues we discovered in moving sites from a test to production server. Content is stored in a per-site Oracle schema, while user identifiers are defined in a per-server schema. When migrating, it's necessary to update user identifiers in the site database. Peter Hoyt and Paul Houle developed a Perl script that examines the database structure, identifies fields that contain user identifiers, and maps them from the old to new server.

title: Gestational Weight Gain, Weight Retention and Risk to Develop Overweight and Obesity in Rural Guatemalan Women
abstract: Data from the INCAP longitudinal study and 1996-1999 follow-up were used to explore the association of total and timing of gestational weight gain (GWG) with postpartum weight retention (PWR) and the risk of developing overweight and obesity at 6 months postpartum in rural Guatemalan women. The contribution of genetics to the variability of GWG was also explored.
Total and timing of GWG and postpartum weight retention: Women with a pre-pregnancy BMI < 30 kg/m2 retained more weight with increasing GWG. We also found that for women who started pregnancy overweight (BMI = 25-29.9 kg/m2) for every month of predominantly exclusive breastfeeding, the PWR at 6 months decreased by 0.8 kg ($p< 0.0001$), whereas in women who started pregnancy with BMI < 25 kg/m2 there was no association between breastfeeding practices and weight retention (Interaction p-value= 0.03). The PWR at 6 months was associated with late GWG, but not with early GWG. Late GWG of 100 g/wk or 2.0 kg for the last half of pregnancy was associated with an increase 1.0 kg in PWR at 6 months. Total and timing of GWG and risk of becoming overweight and obese at 6 months postpartum: After adjusting for initial BMI and breastfeeding practices, the risk of becoming overweight by six months postpartum increased by 40% for every kg of net GWG in women with pre-pregnancy BMI between 20 and 24.9 kg/m2, and the risk of becoming obese increased by 200% for every kg of net GWG in women with pre-pregnancy BMI between 25 and 29.9 kg/m2. The risk of becoming overweight was reduced in women with the most intensive breastfeeding patterns. The late GWG, but not early GWG, was associated with greater risk of becoming overweight at 6 months postpartum.

Heritability of weight change during pregnancy: Our analysis lacked statistical power to test whether weight change during pregnancy is inherited. Studying whether the high variability in weight change during pregnancy has a genetic basis is of clinical and public health interest thus better approaches to address the question need to be explored.

title: HIGH CONFINEMENT SUSPENDED MICRO-RING RESONATORS IN SILICON-ON-INSULATOR
abstract: A method for suspending micro-ring resonators in a silicon-on-insulator substrate was developed. Due to the low insertion loss of the suspension mechanism and high confinement of the resonant cavity, quality factors exceeding 15,000 of micron-size suspended rings were achieved. Often, applications of such resonant cavities require tunability of its resonant wavelength. In this work, we also present two methods of tuning the cavity, one by thermal stimulation and the other by MEMS electrostatic actuation.

title: Tectonic and geologic evolution of Syria
abstract: Publisher's version archived with permission from publisher.Using extensive surface and subsurface data, we have synthesized the Phanerozoic tectonic and geologic evolution of Syria that has important implications for eastern Mediterranean tectonic studies and the strategies for hydrocarbon exploration. Syrian tectonic deformation is focused in four major zones that have been repeatedly reactivated throughout the Phanerozoic in response to movement on nearby plate boundaries. They are the Palmyride Mountains, the Euphrates Fault System, the Abd el Aziz-Sinjar uplifts, and the Dead Sea Fault System. The Palmyrides include the SW Palmyride fold and thrust belt and two inverted sub-basins that are now the Bilas and Bishri blocks. The Euphrates Fault System and Abd el Aziz-Sinjar grabens in eastern Syria are large extensional features with a more recent history of Neogene compression and partial inversion. The Dead Sea transform plate boundary cuts through western Syria and has ssociated pull-apart basins. The geological history of Syria has been reconstructed by combining the interpreted geologic history of these zones with tectonic and lithostratigraphic analyses from the remainder of the country. Specific deformation episodes were penecontemporaneous with regional-scale plate-tectonic events. Following a relatively quiescent early Paleozoic shelf environment, the NE-trending Palmyride/Sinjar Trough formed across central Syria in response to regional compression followed by Permian-Triassic opening of the Neo-Tethys Ocean and the eastern Mediterranean. This continued with carbonate deposition in the Mesozoic. Late Cretaceous tectonism was dominated by extension in the Euphrates Fault System and Abd el Aziz-Sinjar Graben in eastern Syria associated with the closing of the Neo-Tethys. Repeated collisions along the northern Arabian margin from the Late Cretaceous to the Late Miocene caused platform-wide compression. This led to the structural inversion and horizontal shortening of the Palmyride Trough and Abd el Aziz-Sinjar Graben.

title: Tectonic evolution of northeast Syria: Implications for regional tectonics and hydrocarbons

abstract: We present the Phanerozoic tectonic evolution of northeast Syria and incorporate the results into regional deformation models of the northern Arabian Platform and nearby Arabian Plate boundaries. Based on analysis of extensive seismic reflection profiles and well data, we interpret that the Sinjar-Abd el Aziz area in northeast Syria was subsiding under extension at various rates from the Carboniferous until the end of the Mesozoic, most markedly during the latest Cretaceous. The predominant basin through most of the Late Paleozoic and Mesozoic was southwest-northeast trending; this formed the northeast extension of the major Palmyride Basin to the southwest. During the Late Cretaceous, extension in eastern Syria initiated along southeast-northwest and then eastwest trends - possibly as a result of changing subduction geometries and plate motions in the Neo-Tethys to the northeast. The east-west striking faulting resulted in syntectonic deposition of up to approximately 1,600 meters of Late Campanian-Maastrichtian marly limestones in the Sinjar-Abd el Aziz area. The area was subjected to horizontal shortening throughout the Cenozoic, primarily during Plio-Pleistocene time, resulting in structural inversion along some of the faults. Although crustal shortening through the Syrian Sinjar and Abd el Aziz structures is relatively minor (approximately 1%), this has been critical to hydrocarbon trap formation in Mesozoic and Cenozoic strata through the formation of fault-propagation folds. We present regional models that show the interrelated tectonic history of northeast Syria, the Palmyrides, and the Euphrates Fault System are all inseparably linked to the polyphase opening and closing of the nearby Neo-Tethys Ocean.

title: Design and development of information systems for the geosciences: An application to the Middle East
abstract: Publisher's version archived with permission from publisher. http://www.gulfpetrolink.net/publication/geoarabia.htmAs our understanding grows of how the Earth functions as a complex system of myriad interrelated mechanisms, it becomes clear that a revolutionary and novel approach is needed to study and understand it. In order to take advantage of an ever-growing number of observations and large data sets and to employ them efficiently in multidisciplinary studies aimed at solving earth system science problems, we are developing a comprehensive Solid Earth Information System (SEIS). The complex nature of the solid earth sciences raises serious challenges for geoscientists in their quest to understand the nature and the dynamic mechanisms at work in the planet. SEIS forms a first step in developing a broader and more comprehensive information system for earth system sciences designed for the needs of the geoscientists of the 21st century. In a way, SEIS is a step towards the Digital Earth. Application of SEIS to the complex tectonics of the Middle East shows that information systems are crucial in multidisciplinary research studies and open new avenues in research efforts. SEIS includes an Internet module that provides open access to anyone interested. Researchers as well as educators and students can access this knowledge and information system at http://atlas.geo.cornell.edu.

title: A crustal transect across the Oman Mountains on the eastern margin of Arabia
abstract: Publisher's version archived with permission from publisher. http://www.gulfpetrolink.net/publication/geoarabia.htmThe unique tectonic setting of the Oman Mountains and the Semail Ophiolite, together with ongoing hydrocarbon exploration, have focused geological research on the sedimentary and ophiolite stratigraphy of Oman. However, there have been few investigations of the crustal-scale structure of the eastern Arabian continental margin. In order to rectify this omission, we made a 255-km-long, southwesterly oriented crustal transect of the Oman Mountains from the Coastal Zone to the interior Foreland via the 3,000-m-high Jebel Akhdar. The model for the upper 8 km of the crust was constrained using 152 km of 2-D seismic reflection profiles, 15 exploratory wells, and 1:100,000- to 1:250,000-scale geological maps. Receiver-function analysis of teleseismic earthquake waveform data from three temporary digital seismic stations gave the first reliable estimates of depth-to-Moho. Bouguer gravity modeling provided further evidence of depths to the Moho and metamorphic basement.
Four principal results were obtained from the transect. (1) An interpreted mountain root beneath Jebel Akhdar has a lateral extent of about 60 km along the transect. The depthto-Moho of 41 to 44 km about 25 km southwest of Jebel Akhdar increased to 48 to 51 km on its northeastern side but decreased to 39 to 42 km beneath the coastal plain farther to the northeast. (2) The average depth to the metamorphic basement

was inferred from Bouguer gravity modeling to be 9 km in the core of Jebel Akhdar and immediately to the southwest. A relatively shallow depth-to-basement of 7 to 8 km coincided with the Jebel Qusaybah anticline south of the Hamrat Ad Duru Range. (3) Based on surface, subsurface, and gravity modeling, the Nakhl Ophiolite block extends seaward for approximately 80 km from its most southerly outcrop. It has an average thickness of about 5 km, whereas ophiolite south of Jebel Akhdar is only 1 km thick. The underlying Hawasina Sediments are between 2 and 3 km thick in the Hamrat Ad Duru Zone, and 2 km thick in the Coastal Zone. (4) Southwest of Jebel Akhdar, reactivated NW-oriented strike-slip basement faults that deformed Miocene to Pliocene sediments were inferred from the interpretation of seismic reflection profiles.

title: DEPOSITION OF ORGANIC THIN FILMS USING ENERGY TUNABLE MOLECULAR BEAMS ON SILICON DIOXIDE AND OCTADECYLTRICHLOROSILANE MODIFIED SILICON DIOXIDE
abstract: Organic semiconductors, in particular organic thin-film transistors (OTFTs), have been gaining recognition and spurring development in the electronics world now for more than a decade. The use of organic semiconductors is playing an ever increasing role in today?s industrial research in an effort to fill niches in technology left behind by traditional semiconductors such as silicon.
The vast majority of research leading this outreach has been limited to the capabilities of thermally evaporated

deposition techniques. A more advanced approach to investigating the underlying growth mechanics of organic semiconductors employs the use of a tunable molecular beam. Through controlling the expansive parameters of a molecular gas, a supersonic beam for molecular deposition can be created with strict control over the incident kinetic energy.
This supersonic beam technique was employed to study the growth characteristics of pentacene and how they pertain to the electrical properties of an organic semiconducting device. At a constant growth rate, films were deposited at three incident kinetic energies (1.5 eV, 2.7 eV, 4.5 eV, and 6.7 eV) and analyzed using ellipsometry and atomic force microscopy. Growth characteristics of the film (roughening exponent ?, growth exponent ?, and the correlation length) were then extracted. Finally, surface modification of the dielectric with the self-assembled monolayer (SAM) octadecyltrichlorosilane (OTS) was used to influence the nucleation and growth parameters of the pentacene film. These parameters were studied as a function of the incident kinetic energy and electrical properties that resulted.

title: Cosmic Superstrings: Observable Remnants of Brane Inflation
abstract: Brane inflation provides a natural dynamical model for the physics which underlie the inflationary paradigm. Besides their inflationary predictions, brane models imply another observable consequence: cosmic strings. In this dissertation I outline the background of how cosmic strings arise in brane inflationary models and how the properties of the strings and the models are mutually tied (Chapter 2). I then use cosmological observations to put limits on the properties of any actually-existing cosmic string network (Chapter 3). Next, I study the question of how cosmic superstrings, as the cosmic strings arising from string theory are known, could be distinct from classical gauge-theory cosmic strings. In particular, I propose an analytical model for the cosmological evolution of a network of binding cosmic strings (Chapter 4); I also describe the distinctive gravitational lensing phenomena that arecaused by binding strings (Chapter 5). Finally, I lay out the background for the numerical study of a gauge theory model forthe dynamics of cosmic superstring binding (Chapter 6).

title: Tapir User Manager
abstract: User management is essential for community and interactive web systems. User management is often an afterthought in a project; although it is critical to the usability (a user that can't register log in can't use the service) and managability of a site, developers often build ad hoc solutions that are unreliable, insecure and hard to use.
Tapir User Manager is a user management system that's been used to support large traffic sites. This presentation introduces TUM and explains how it's been used for projects at CUL and elsewhere.

title: A tunable carbon nanotube resonator
abstract: Nanoelectromechanical systems (NEMS) have recently been the subjectof much exciting research. They have been proposed for use in various applications such as mass and force detection, RF processing, and investigating quantum effects in the mechanical motion of resonators. Attempts to increase sensitivity for these applications has led to further and further miniaturization of the mechanical devices. When their size reaches the range of hundreds of nanometers, these devices have active masses in the hundreds of the femtograms and operational frequencies in the GHz. An ultimatelimit to this miniaturization is a mechanical resonator based on a single molecule. Such a resonator should not only be able to push the limits of the measurements sensitivities, but can also probe decrease of the quality factor values with size that has so far been attributed to the increase of the surface-to-volume ratios in these resonators. Carbon nanotubes (CNTs), thin tubes of graphene, are light, stiff, strong, and electrically active, which makes them a perfect candidate for a such a NEMS structure.
By employing a capacitive actuation and detection technique, we investigate the performance of a resonator based on a doubly-clamped, suspended CNT in a transistor geometry. We excite vibrations by applying an AC driving voltage to the gate electrode, and we detect them by measuring the current through the CNT device. Controlling the CNT's tension, by applying a downward DC force with a DC voltage on the gate electrodes, enables us to tune the resonant frequency, resulting in the first tunable and self-detecting carbon nanotube resonator.
This setup also allows us to probe the loss mechanisms in these small structures. We systematically study correlation of the quality factor with each of the device characteristics, including electrical resistance, fabrication geometry, and resonant mode harmonic number. We also study dependence of the quality factor on the experimental knobs, such as pressure, temperature, DC gate voltage, and AC driving voltage. We find that the quality factors in CNTs continue the trend previously established by NEMS, and that several dissipation mechanisms must be responsible for losses in this system. We identify coupling to the environment, the thermoelastic effect, and surface-related losses as the three key mechanisms.

title: Generalized noncrossing partitions and combinatorics of Coxeter groups
abstract: This thesis serves two purposes: it is a comprehensive introduction to the ``Catalan combinatorics'' of finite Coxeter groups, suitable for nonexperts, and it also introduces and studies a new generalization of the poset of noncrossing partitions. This poset is part of a ``Fuss-Catalan combinatorics'' of finite Coxeter groups, generalizing the Catalan combinatorics.
Our central contribution is the definition of a generalization $NC^{(k)}(W)$ of the poset of noncrossing partitions corresponding to each finite Coxeter group W and positive integer k. This poset has elements counted by a generalized Fuss-Catalan number $\Cat^{(k)}(W)$, defined in terms of the invariant degrees of

W. We develop the theory of this poset in detail. In particular, we show that it is a graded semilattice with beautiful structural and enumerative properties. We count multichains and maximal chains in $NC^{(k)}(W)$. We show that the order complex of $NC^{(k)}(W)$ is shellable and hence Cohen-Macaulay, and we compute the reduced Euler characteristic of this complex. We show that the rank numbers of $NC^{(k)}(W)$ are polynomial in k; this defines a new family of polynomials (called Fuss-Narayana) associated to the pair (W,k). We observe some fascinating properties of these polynomials.
We study the structure $NC^{(k)}(W)$ more specifically when W is a classical type A or type B Coxeter group. In these cases, we show that $NC^{(k)}(W)$ is isomorphic to a poset of ``noncrossing'' set partitions in which each block has size divisible by $k$. Hence, we refer to $NC^{(k)}(W)$ in general as the poset of ``k-divisible noncrossing partitions''. In this case, we prove rank-selected and type-selected enumeration formulas for multichains in $NC^{(k)}(W)$. We also describe new bijections between multichains of classical noncrossing partitions and classical k-divisible noncrossing partitions.
It turns out that our poset $NC^{(k)}(W)$ shares many enumerative features in common with the generalized nonnesting partitions of Athanasiadis and the generalized cluster complex of Fomin and Reading. We give a basic introduction to these topics and describe several new conjectures relating these three families of ``Fuss-Catalan objects''. We mention connections with the theories of cyclic sieving and diagonal harmonics.

title: A Meta-Analysis Of Published Literature On The Role Of Loose Parts In The Play Behavior Of Non-Typically Developing Children
abstract: Prior research shows that the type of props that typically developing children play with may affect the amount and quality of their play. Less research has been conducted on the role of loose parts in the play behavior of non-typically developing children. This thesis was conducted in order to expand the knowledge on this topic. Five studies were analyzed; the published research suggests that loose parts props can aid non-typically developing children to engage in dramatic play, especially when prompted.

title: Analysis and Design of a Hyper-Elliptical Cambered Span Morphing Aircraft Wing
abstract: Morphing aircraft are a focus today due to their ability to combine multiple mission flexibility with a single vehicle. The Hyper-Elliptical Cambered Span (HECS) wing is one such wing being developed as a testbed for morphing technologies, due to its ability to vary the spanwise curvature in order to alter a craft's lift-to-drag performance. Through analysis of the aft-swept wing geometry and review of theory, predictions of aerodynamic performance are benchmarked against quasi-static rigid wing models in the Cornell University low-speed wind tunnel facility. Models assume a discretized approximation of the continuously varying spanwise curvature, with system order reduced significantly via a spool-and-tendon mechanism linking

motions proportionally. The traditional rib-and-skeleton framework is replaced by a composite structure more adept at withstanding compressive loads due to actuation as verified through finite element analysis. Actuation methods are contrasted between a DC motor driven system and one employing shape memory alloy (SMA) wires, which generate proportional motion by linking sections electrically rather than mechanically. An energy comparison reveals the SMA wire to be more efficient, resulting in a prototype with embedded SMA wire actuators. The prototype employs a nonlinear proportional-integral controller to reach desired wing setpoints, which can be modified to user specifications based on flight conditions. A thermomechanical system model for the SMA is detailed and implemented in the feedback law, which relates well to observed actuation. The prototype half-wing is dynamically tested over a range of angle of attack in the wind tunnel facility. Results confirm the hypothesis that the planar wing will perform better than an elliptical wing of comparable characteristics, while morphing to the 'furled' state further increases lift-to-drag only over a small range of angle of attack. The SMA mechanism is demonstrated to be a viable means of morphing the wing, capable of overcoming aerodynamic loads and holding a desired wing shape based on the feedback law. Metrics of success are delineated and future revisions and inclusions are discussed.

title: Participation and Social Learning in Church-Based Organizations: Implications for Poverty Eradication in Nigeria
abstract: The task of poverty eradication requires the joint action of various agencies (IFAD, 2001). In Nigeria, there is a lack of alternative institutions to counter the social processes entrenched in local settings that lead to poverty (Obadan, 2002). The main purpose of this study is to investigate the potentials of Church-based organizations (CBOs) as alternative mechanisms for poverty eradication. I begin by defining poverty from a country perspective and argue that modernistic tendencies have led to a limited understanding. I proffer a communitarian approach for understanding the meaning of poverty and its eradication strategies. I examine the organizational dynamics of a diocese in order to explore the elements within its structure that favor social inclusion in relation to the Roman Catholic Social Justice Agenda.

I use Social Learning theory as a theoretical framework to assess how a diocese learns to build on the capacity of individuals and groups as stakeholders that influence poverty eradication at the local level. I build on the role of religious emotions and spiritual values in improving the professional practice of a diocese toward poverty eradication. I also investigate how the means of communication play a role in improving social learning within a diocese, tracing the old social learning tradition from individual cognitions to the new understanding of social learning in social group dynamics. Based on the shifting paradigm in development, I analyze the implications of social learning for CBOs in designing learning for individuals and groups.

I further review the concept of Participation and its role in poverty eradication, tracing the historical evolution of participation from the basic needs approach to the populist model that emphasizes broader processes of governance within organizations. The implication of this paradigm shift for CBOs is that a diocese as an organization can learn to become a social change agent by reviewing its "structures" and its understanding of "power." I set out to investigate the Catholic diocese of Ogoja Nigeria, to explore its potential to involve people in social development and the fight against poverty.

title: CARPET WEAVERS AND WEAVING IN THE GLOBAL MARKET: THE CASE OF TURKEY

abstract: The purpose of this study is to examine factors affecting the lives of women who weave carpets in rural Turkey by investigating these questions: 1) Why do rural Turkish women weave carpets? 2) What are the influences of the global market on carpet design? 3) In what ways is the government involved in the weaving industry?

Data were collected in Turkey during the summer of 2005 from weavers, university professors, government officials, and carpet dealers. Data collection took place via key-informant interviews, observation of carpets and weaving venues, and gathering statistical information. These data were then analyzed as case studies pertaining to the research questions.

The intention of this thesis is to present a picture of some of the factors that impact the lives of rural Turkish women, and how these factors are reflected in the carpets that they weave. These factors include the economy and geographic location of their villages, access to markets and education, and local traditions.

The findings of this research suggest that if other income generating activities are available, women seem to be less likely to weave for sale. This also appears to be true if women continue their educations beyond the eighth-grade level. Even so, a tradition of weaving, and the pride and creative outlet associated with being a good weaver may mean that some women will continue to weave for themselves. Also, high-end weaving may be able to generate enough income to be attractive labor even when other opportunities are available. Some women were found to alter traditional designs in order to suit the global market; others were not. This may be due to contact, or lack thereof, with consumers in the global market. The government appears to be withdrawing support from the weaving industry, although changes in policy in anticipation of accession to the EU may strengthen the industry. It seems as though the low-end weaving industry might disappear, but high-quality weaving may continue.

title: COMPOSITE LIKELIHOOD AND REGRESSION BASED METHODS FOR INFERRING POPULATION GENETIC PARAMETERS FROM DNA SEQUENCES
abstract: This doctoral dissertation is composed of three projects and four chapters. Chapter 1 presents the background theories and models in the field of population genetics that are related to these projects.

In Chapter 2, I develop a composite likelihood ratio test (CLRT) for detecting genes and genomic regions that are subject to recurrent natural selection while relaxing the assumption of free recombination. We find that the test has excellent power to detect weak negative selection and moderate power to detect positive selection. Moreover, the test is quite robust to the bias in the estimate of local recombination rate, but not to certain demographic scenarios such as population growth or a recent bottleneck.

In Chapter 3, I present a novel method, Poisson pairwise difference method (PPDM), which efficiently co-estimates the selection coefficient and mutation rate from arbitrarily correlated SFS data. We demonstrate that the PPDM log-likelihood ratio test has good power to detect positive selection and moderate power to detect weak negative selection.

Current state-of-the-art approaches for quantifying meiotic recombination rates (R) and/or identifying hotspots are mostly based on the likelihood of observed haplotypes or linkage disequilibrium (LD) patterns. In Chapter 4, I describe a flexible, efficient, and population structure robust approach via multiple linear regression and non-parametric bootstrap based on the frequency spectra of unphased single nucleotide polymorphism sites (SNPs) and provide confidence intervals of R between adjacent pairs of SNPs. No LD information is required. We evaluate this new approach via Monte Carlo simulation as well as application to the well-characterized hotspots near the human TAP2 gene and a 206-kb region on ch1q42.3 near MS32.

title: On Metadata: Performing Arts Materials In Our Digital World
abstract: Along with the paper file in PDF format are a number of tab-delimited text files that contain the current contents of certain performing arts vocabulary lists in the database. These are the lists of functions, performing arts roles, sections of performance, types of significant components in the performing arts, and types of pieces. Each file is prefaced with a short explanation of the use of the list in the database system.This paper is intended to describe the development of the Global Performing Arts Database (GloPAD) system for performing arts materials, in particular to describe for non-information technology people the metadata structure on which this system is based and how this structuring relates to the study of performing arts. After a brief introduction to the workings of the database system, this paper discusses the crucial information structures for the study of performing arts histories, focusing in particular on how to describe performance productions, pieces that are performed, and the functions of people within the performing arts.
The Global Performing Arts Database (GloPAD) is an online, multilingual system that collects and offers for display digital media and their descriptive information. While the database itself is a complex arrangement of tables and rows of numbers and text and relations among them, the real power of the system lies in the interfaces that allow information to be entered or extracted from that arrangement of data tables. The main power of these interfaces is that they allow many people to write and read on the same collection of items and their information. There are two main interfaces for GloPAD: an "Editors' Interface" that allows a group of editors to add and edit information and to upload digital files such as photos or video, and a "Public Interface" that displays the items and their related information. Both of these interfaces are Web-accessible. Structurally the heart of the GloPAD system is the Editors' Interface, for it is the environment that allows the collaborative addition and revision of information and it defines the records that can be created by editors.
The event of performance is the core around which other information is built. The performance moment (which may be represented by the tenth of a second required to click a camera, or the 30 minutes of a video recording) is the momentary act of performance caught in the artifact object (digital object). The subject for GloPAD is the performing art history that is related to the artifact.Creating an Open Access Paradigm for Scholarly Publishing, a project funded by Atlantic Philanthropies

title: Effective Hamiltonians of the pyrochlore antiferromagnet
abstract: The pyrochlore lattice Heisenberg antiferromagnet is a highly frustrated model, and possesses, classically, a macroscopic continuous ground state degeneracy. We study the semiclassical limit of large spin length S and examine the effect of quantum fluctuations on the energy within various theories. In each of these theories, we focus on deriving an effective Hamiltonian, as a function of a small number of degrees of freedom. The effective Hamiltonian gives us a simple formula for calculating the energy and facilitates the search for a unique ground state among the large number of classical ground states.
First, we consider the harmonic spin-wave theory, in which we keep only the lowest order (in 1/S) correction to the classical Hamiltonian. We perform a detailed analysis of the harmonic order spin-wave modes and, using a real-space loop expansion, produce an effective Hamiltonian, in which the degrees of freedom are Ising variables representing products of the classical spin directions around loops in the lattice. We find a family of exactly degenerate collinear ground states, related by gaugelike Z2 transformations and provide bounds for the zero-temperature entropy.
We carry the spin-wave calculation to the next ?anharmonic? order in the 1/S expansion, utilizing a a self-consistent variational Hamiltonian approach, equivalent to Hartree-Fock approximation. We find that the harmonic degeneracy is broken, but there remain a large number of seemingly degenerate ground states. We develop an alternative approximation, employing the widely used, but not well controlled generalization of the SU(2) ?= Sp(1) theory to Sp(N), in the limit of infinite N. We develop an effective Hamiltonian for this mean-field theory, using an analytical loop-expansion. We find that in this case, the ground state of the large-N theory cannot possibly be the physical ground state in the limit S ? 1, since it is not a harmonic spin-wave ground states. Nonetheless, when restricted to the manifold harmonic spin-wave ground states, both the anharmonic spin-waves and the large-N theory result in similar effective Hamiltonian. We further demonstrate that the harmonic theory can readily be applied to determine the harmonic-order ground state manifolds of the Heisenberg Hamiltonian on related lattices, and to field-induced collinear magnetization plateau states.

title: The International Criminal Court, Sovereignty, and the United States: global power and the case for non-participation
abstract: At the heart of the debate over the International Criminal Court lies the amorphous notion of globalization. Calling into question the normative assumptions driving international humanitarian efforts, the evolving conception of the sovereign state, strategic interactions among countries and the ability of the international community to work multilaterally towards a common vision of justice, the debate spans a broad range of issues concerning global governance. The United States? rocky relationship with the International Criminal Court is a particularly revealing entry point. Is the United States? opposition simply an expression of unilateralist arrogance and refusal to concede to an increasingly important system of global governance that much of the international community accepts? In fact, American non-support runs much deeper. Both a strategic approach to United States? foreign policy objectives and an examination of the ideological incompatibilities between the United States? Constitution and participation in the Court reveal the centrality of sovereignty in the debate. In a strategic sense, it is not in the interest of the United States to concede judicial autonomy to the International Criminal Court. In an ideological sense, the tensions are seemingly irresolvable. Both point to why the United States has become a global hegemonic power and how this hegemony plays out. Further, both reveal just how deeply the International Criminal Court renegotiates state sovereignty by shifting the standards of international human rights law. This thesis proceeds in three stages. First, it explores the position the International Criminal Court occupies in relation to the established tradition of international and specifically human rights law. Second, it evaluates the argument against American participation in the Court examining the alleged dissonance with constitutional democracy and tangible threats the institution poses to US foreign-relations objectives. Finally, it places the debate in the context of larger theoretical questions concerning sovereignty. Does the Court create an upheaval in the global order of sovereign nations in general? Or, does this claim of universality thinly veil the United States? ultimately particular concerns about the maintenance of hegemony within a changing global order. This thesis ends by exploring the potential alternatives for creating better agreement between the most deeply held ideological concerns driving the United States? foreign policy and the changing demands of international political environment while questioning the efficacy of international criminal adjudication in achieving human rights goals.

title: Teacher Expertise and Personal Theories of Learning: Master and Novice Teachers' Interpretations of a Constructivist Teaching Episode
abstract: This study is an investigation of some of the similarities and differences between Novice and Master science teachers. The research focused on Novice and Master teachers? personal theories of learning as revealed through their perception and interpretation of a videotape of a teaching episode. The teaching episode was selected to illustrate teaching practices consonant with constructivist learning theory. Participants? interviews, during and following the video-clip, provided the sources of data. I transcribed all the interviews and analyzed them using both deductive and inductive analysis tools. Category development proceeded using both open-coding, for data-driven category development, as well as anticipated categories drawn from the three theoretical frameworks. Anticipated categories were drawn from research studies of teacher expertise, from the teacher development literature, and from cognitive science expert/novice research. Qualitative data analysis methods were used to determine Novice and Master teachers? perceptions and interpretations of the video-clip. The Novice teachers were pre-service science teachers. Some had completed student teaching and some were about to student teach. The Master teachers were Nationally Board Certified science teachers. The Novices were students in a reform-based teacher education program. They have had a variety of experiences with contemporary methods of instruction, but from this research, appear to straddle both a traditional approach to learning and a more constructivist approach. For both the Novices and the Master teachers, the best indicators of their personal theory of learning lies with the role they see for the teacher in the science classroom, the degree of responsibility for learning that is placed on students, and the role student misconceptions play in teaching and learning science.

title: MILLIMETER WAVE TRANSCEIVER FRONTEND CIRCUITS IN ADVANCED SIGE TECHNOLOGY WITH CONSIDERATIONS FOR ON-CHIP PASSIVE COMPONENT DESIGN AND SIMULATLION
abstract: A novel design approach for implementing millimeter wave wireless transceiver front-end circuits is proposed. The design methodology takes advantage in advances in Silicon Germanium (SiGe) fabrication technology and sophisticated Electro-Magnetic (EM) simulation software to ensure successful implementation of circuits designed to operate in millimeter wave range. The discussion covers basic circuits common in typical transceiver architecture such as low noise amplifier (LNA), active balun, and mixer. The design methodology is not limited to the above circuits. It can be applied to many other situations where operating frequency is high and the dimensions of passive structures are comparable to signal wavelength.

A comprehensive solution to the design of millimeter wave wireless transceiver front-end circuits requires consideration for active devices as well as passive structures. For circuits operating at 94 GHz, 40 GHz and 18 GHz discussed in this dissertation, each design generally has two parts of discussion ? one devoted to circuit design and one devoted to passive design. Optimization of circuit performance and reliability is analyzed in each case. Simulation results from both the circuits and the passives are presented and an integrated simulation environment is proposed to simply the design flow. Some measurement results are provided to confirm the validity of the proposed design methodology. Summaries are given at the end of each chapter and future research direction is highlighted at the end of the dissertation.

title: EVALUATING EFFECTS OF ECOLOGICAL CHANGE ON IMPORTANT SPORT FISHES IN ONEIDA LAKE, NEW YORK
abstract: Aquatic ecosystems provide numerous resources to diverse user groups. As a result, these systems are often targets of planned management actions but are also sensitive to uncontrolled biological invasions. Oneida Lake has a rich history of ecological study across multiple trophic levels and has experienced notable perturbations to its food web during the past half-century. To evaluate large-scale ecological changes, I used multiple approaches to examine dynamics in several long-term data series. In Chapter 1, I quantified age-0 yellow perch density at four early life stages and calculated mortality and growth rates. At all stages, densities have declined over time. Mortality rates from egg to 18mm showed no time trend, increased for 18mm - 1 Aug., and decreased from 1 Aug. - 15 Oct. Depensatory mortality, prevalent in the 1960s to early 1970s, was not seen in recent years. Growth has increased, was density dependent, and was significantly correlated with increased Secchi depth. The combined effect has been a decline in abundance and an increase in individual size by the end of the first year. In Chapter 2, I combined three long-term data sets for walleye to simultaneously estimate mortality, catchability in gillnets and trawls, and density using a non-linear minimization routine. A multi-mortality model with two time periods suggested decreased fishing mortality but increased sub-adult mortality during recent years when more restrictive size limits were in place and double-crested cormorants were abundant. In Chapter 3, I used gillnet and bottom trawl catches to identify changes in fish abundance after zebra mussel colonization. Based on a priori expectations, I evaluated changes between pre- and post-zebra mussel periods and compared observed values with projections from 30-year population trajectories. Between periods, gillnet catches of Pelagic fishes declined while catches of Littoral and Benthic fishes increased. Population trajectories indicated declining percids; however, gillnet catches of smallmouth bass and pumpkinseed sunfish remained high throughout much of the zebra mussel period. Changing ecological conditions (increased water clarity, temperature, and macrophytes; altered nutrient pathways; and variable top predators) appear to favor a fish community shift away from percids and towards centrarchids.

title: The Idea of Timbre in the Age of Haydn
abstract: At the end of the 18th century, instrumental music, formerly subordinate to vocal music and shackled to the doctrine of imitation, dramatically emerged as a new and powerful form or art, capable of expression. Many scholars today turn to developments in aesthetic philosophy--the birth of German Idealism, “absolute music,” or Kantian formalism-- to explain the changing perception of instrumental music. Such

explanations, though they illuminate important aspects of contemporary philosophy, ultimately blind us to fascinating developments in musical practice. This dissertation locates the heart of this transformation not in philosophical aesthetics, but in the musical medium itself, specifically focusing on the birth of the concept of timbre and the ensuing transformations to musical discourse.

Tracing the concept of timbre from its birth in the writings of Rousseau through its crystallization in the early 19th century with the emergence of "orchestra machines" and a widespread obsession with effect, the dissertation explores the impact of the new focus on the musical medium in different registers of musical culture. The project examines the use of the metaphor of color borrowed from painting and Newtonian science, the philosophical attitudes towards transience and sensation in the writings of Kant and Herder, ideas of composition and orchestration in music treatises, and composers' new uses for the orchestra through close analysis of Haydn's style of orchestration in the 1790s. In addition, the dissertation draws upon as resources many now-forgotten instruments that were invented in this period. Celebrated in their day, these instruments serve as invaluable repositories of the sonorities that captured the 18th- and early 19th-century ear.

These changes in musical practice were fueled by the solidification of the orchestra as a concept, musical body, and institution. Whereas earlier critics likened instrumental sonorities to random paint splatters, later thinkers emphasized the individual character and inherent expressive capacity of each instrument. Only after this radical reevaluation of its foundations could music begin to be recognized as a means to connect with the human heart and mind.

title: Convection-Enhanced Drug Delivery: Porous Media Models and Microfluidic Devices
abstract: Promising treatments of many brain diseases are often thwarted due to their inability to cross the blood-brain barrier. Convection-enhanced drug delivery (CED) uses direct infusion of drug-containing solutions into tissue to circumvent the blood-brain barrier. The aim of this thesis was to combine models of transport in porous media with microfabricated devices to develop novel methods for controlling the distribution of infused drugs. We used a poroelastic model of the brain to explore the effect of infusion induced dilation on transport. We calculated that during infusions at flow rates greater than one microliter/minute, the effective pore size of the extracellular matrix was doubled by dilation from approximately fifty nanometers to one-hundred nanometers. A computational fluid dynamic model of the rat brain determined the perturbation of the flow field between white and gray matter. We found no further perturbation of the flow field when the ratio of permeabilities between white and gray matter exceeded one-hundred. The results of our models suggest that the material properties of a targeted tissue region dictate the transport of infused solutions. To better control and manipulate drug distribution we developed a novel microfluidic platform for delivering drug-solutions at flow rates relevant for CED. The microfluidic devices consisted of parylene channels with a cross-section area of fifty microns by ten microns on a silicon structure with a cross-sectional area of one-hundred microns by one-hundred microns. These probes were tested in the normal rat brain and demonstrated performance advantages over standard needles, including no channel occlusion and attenuation of backflow. We expanded on the simple single channel device to implement more advanced strategies using multiple channels. A two-channel device was fabricated for infusing an enzyme or mannitol solution prior to infusing polystyrene nanoparticles. By pre-treating the targeted tissue region with enzymes or mannitol we increased the effective pore size of the extracellular matrix which resulted in a doubling of the distribution volume of nanoparticles.

title: Continuity in categorization and theoretical implications
abstract: sorry for the silly error. hopefully this'll do the trick. --rickTraditional theories of cognition assume that motor action is executed in an all-or-none fashion, and has little importance for understanding cognitive representation and processing. A series of experiments and simulations presented here challenges this assumption. A relatively higher-order cognitive process, categorization, is shown to have graded effects that are reflected in manual motor output, measured through streaming x-y coordinates from mouse trajectories. Two simulations show that these effects are likely generated from a system in which cognition and action interact fluidly. Finally, theoretical implications of these experiments are drawn out. Symbolic dynamics is introduced, a potential means for reconciling both traditional and continuous accounts of cognition. A broad philosophical discussion follows, in which an integrative and pluralistic approach to cognition is proposed and briefly discussed.

title: Spatial distributions of Lake Erie walleye
abstract: The spatial distributions of Lake Erie walleye stocks are examined from tagging data from 1990-2001. Releases and recoveries from four western basin tagging sites ? Monroe, Chicken and Hen Islands, Sandusky Bay, and Sandusky River ? and from one eastern basin site, Van Buren Bay, are analyzed. Walleye tagged at the Monroe, Chicken and Hen Islands, and Van Buren Bay are considered individual stocks and walleye tagged at the Sandusky Bay and Sandusky River sites are considered one stock. Spatial distributions are quantified by construction of a spatially-explicit population model that follows groups of releases from the first May after spring tagging through October of the second year after release and estimation of model parameters in a maximum-likelihood framework. Two different estimation frameworks are implemented that handle tag-loss rates and tag-reporting rates uniquely, so the effects of these ?nuisance parameters? can be analyzed. The results confirm previous tagging studies that show movement of western basin walleyeGreat Lakes Fisheries Commission

title: The role of mast cells in rapid expulsion of Trichinella spiralis in the rat
abstract: The aim of this research was to test the hypothesis that immune complexes activate mucosal mast cells to cause rapid expulsion of the Trichinella spiralis from the rat intestine. Rapid expulsion is a phenomenon in the rat that is characterized by nearly complete elimination of a secondary infection. To test this hypothesis, mast cells were cultured from bone marrow precursors. These cells have a homogenous mucosal phenotype and were compared with the mucosal mast cell line, RBL-2H3 cells. Each cell type was assayed for binding and activation by parasite specific immune complexes. The results showed that IgE- and IgG2a-containing immune complexes bound and activated RBL-2H3 cells, but only IgE significantly activated bone marrow-derived mast cells (BMMC). IgG1 and IgG2b immune complexes bound both cells types but did not trigger degranulation. IgG2c did not bind mast cells. Because IgG2a-containing complexes activated RBL-2H3 cells in vitro and this isotype differed from other isotypes in its mechanism for induction of rapid expulsion, we investigated whether this isotype might activate mast cells in vivo. Rats infected with Heligmosomoides polygyrus then passively immunized with IgG2a demonstrated rapid expulsion without significant mucus

entrapment of larvae. IgG2a-mediated protection was complement independent and Fc-dependent; however, no significant increase in RMCP-II release was detected during expulsion. These results are consistent with a role for other FcR-bearing cells in IgG2a-mediated protection. In a parallel investigation, confounding inflammatory factors induced by oral infection were eliminated by assaying rapid expulsion induced by parenteral infection. Protection conferred by parenteral immunization was as potent as that induced by natural infection was more robust than the H. polygyrus model. Parenterally infected rats did not display intestinal mastocytosis, eosinophilia, or goblet cell hyperplasia; however, mast cells were activated and mucus entrapment of larvae occurred at levels comparable to those observed in rats infected naturally. Complement was not necessary for protection mediated by parenteral immunization.

title: Leveraging Intercultural Work Relationships: A Study of Cultural Diversity, Perceptions and Leader-Member Exchange between Expatriate Managers and Host National Subordinates
abstract: The purpose of the dissertation is to understand the positive and negative processes of intercultural work relationships between expatriate managers and host national subordinates. As such, the research question is: How does cultural diversity affect the quality of work relationships between expatriate managers and host national subordinates? To answer the question, ideas are drawn from the cultural diversity literature and leader-member exchange theory. Hypotheses are proposed that cultural diversity can positively and negatively relate to the quality of the work relationships depending on how it is perceived by the parties involved. Specifically, if cultural diversity is perceived as a source of dissimilarity, it leads to an affect-based process, negatively impacting the quality of the work relationships. If it is perceived as a valued resource, on the other hand, it leads to a resource-based process, positively affecting the quality of the work relationships.
Using a sample of 72 expatriate manager- host national subordinate dyads, regression analyses are performed to test the proposed hypotheses. The results indicate that indeed, perception of dissimilarity relates negatively, and perception of resource value relates positively, to the quality of the work relationships. Partial support is found that the perceptions mediate the relationships between cultural diversity and the quality of the work relationships. Furthermore, there are different processes for expatriate managers and host national subordinates. The comparison between the two revealed that: (1) expatriate managers regard value diversity (deep level cultural diversity) more negatively as a source of dissimilarity, whereas host national subordinates regard it more positively as a valued resource; (2) host national subordinates are more open to nationality differences (surface level cultural diversity) than expatriate managers. In addition, a positive relationship is found between the quality of the work relationships and host national organizational commitment, task performance and organizational citizenship behaviors, underscoring the long-term significance of expatriate-host national work relationships for multicultural organizations. Overall, the findings suggest that leveraging

intercultural work relationships for competitive advantage requires strategies to develop host nationals in addition to the expatriate managers.

title: The Equatorial Electrojet: Radar Observations and Modeling
abstract: This dissertation describes a theoretical, experimental, and modeling investigation of the equatorial electrojet. We review low latitude ionospheric current models, synthesizing developments from the early times until the present. We then show how to utilize equatorial electrojet irregularities to infer E region electron density and wind profiles from coherent scatter radar experiments. The procedure involves a numerical model of the equatorial ionosphere that relates the vector electric field and current density to the winds.
We present electron densities inferred in the equatorial electrojet inferred using a new bistatic radar system installed between Paracas and Jicamarca, Peru. The radar system monitors density profiles using a coherent scatter radar technique that utilizes the Faraday rotation of the scattered signal. Radar measured density profiles are validated by comparing with other electron density measures.
A three dimensional electrostatic potential model of the equatorial ionosphere in a magnetic dipole coordinate system is described. The model incorporates realistic ionospheric conductivities, electric fields, winds, and includes anamalous collision effects. The model utilizes bistatic radar measured densities, coherent scatter spectral measurements made at large zenith angles, and electric fields derived from 150 km echo drifts. The model is also constrained by magnetometer records.
We next present a technique for extracting zonal winds in the equatorial electrojet from the Doppler shifts of type II radar echoes measured by a narrow beam, obliquely oriented antenna at the Jicamarca Radio Observatory. The wind profiles were retrieved by combining the 3-D model with theory and measurements of type II echo Doppler shifts. The amplitude and phasing of the calculated wind profiles are in general agreement with satellite and rocket-borne wind measurements. We have used height varying type I radar echoes and large-scale electrojet irregularities inferred from interferometric imaging to validate wind profiles estimates derived from type II echoes.

title: The Deke House at Cornell: a concise history of the Delta Chi Chapter of Delta Kappa Epsilon, 1870-1930
abstract: Electronic reproduction.
The story of the Chapter's founding and development during the first sixty years.
Interim draft of 29 May 1994, reformatted and revised, 25 November 2005.The author recounts the Chapter's founding in 1870, the conduct of meetings, literary exercises, social gatherings, involvement in University activities, and matters of internal discipline. The author identifies the first and second Halls of DKE (rented meeting chambers) in downtown Ithaca, the occupation of the first lodge on Ozmun Place in 1877 and the ultimate construction of the present lodge at 13 South Avenue in 1893. The author addresses rushing, pledging, dining, chapter customs, inter-fraternity affairs, fraternity politics within Delta Kappa Epsilon, incidents involving the undergraduate brothers and the exploits of alumni up until the year 1930.

title: Angle Sums on Polytopes and Polytopal Complexes
abstract: We will study the angle sums of polytopes, working to exploit the analogy between the f-vector of faces in each dimension and the α-vector of angle sums. The Gram relation on the α-vector is analogous to the Euler relation on the f-vector. Similarly, the Perles relations on the angle sums of simplicial polytopes are analogous to the Dehn-Sommerville relations.
First we describe the spaces spanned by the angle sums of certain classes of polytopes, as recorded in the $\alpha_{}$-vector and the α-f-vector. Families of polytopes are constructed whose angle sums span the spaces of polytopes defined by the Gram and Perles equations. This shows that the dimension of the affine span of the space of angle sums of simplices is $\left\lfloor \frac{d-1}{2}\right\rfloor$, and that of the combined angle sums and face numbers of simplicial polytopes and general polytopes are $d-1$ and $2d-3$, respectively.
Next we consider angle sums of polytopal complexes. We define the angle characteristic on the α-vector in analogy to the Euler characteristic. Then we consider the effect of a gluing operation to construct new complexes on the angle and Euler characteristics. We show that the changes in the two correspond and that, in the case of certain odd-dimensional polytopal complexes, the angle characteristic is half the Euler characteristic. In particular, we show that many non-convex spheres satisfy the Gram relation and handlebodies of genus g constructed via gluings along disks have angle characteristic $1-g$.
Finally, we consider spherical and hyperbolic polytopes and polytopal complexes. Spherical and hyperbolic analogs of the Gram relation and a spherical analog of the Perles relation are known, and we show the hyperbolic analog of the Perles relations in a number of cases. Proving this relation for simplices of dimension greater than 3 would finish the proof of this result. Also, we show how constructions on spherical and hyperbolic polytopes lead to corresponding changes in the angle characteristic and Euler characteristic. However, the angle characteristic and Euler characteristic do not have the 1:2 ratio that held for Euclidean polytopal complexes.This work was partially supported by NSF grants 0100323 and 9983660.

title: Social Behavior in FMR1 KO Mice: a Model of Fragile X Syndrome
abstract: The fmr1 “knockout” (KO) mouse is a model for fragile X syndrome, the most common form of heritable mental retardation (Hagerman, 2002). The present study was designed to further assess the validity of this mouse model. Specifically, in light of the prominence of social anxiety in the human FXS phenotype, the present study assessed various aspects of social behavior in fmr1 KO mice and wild-type (WT) littermates. A three-chambered apparatus was used to assess: (1) the preference for being near a novel conspecific vs being alone; and (2) the preference for a novel conspecific vs. a familiar one. In the first phase, experimental subjects were exposed to a restrained unfamiliar male mouse in one of the side compartments. Subsequently, in the second phase, a second unfamiliar male mouse was restrained in the opposite compartment. In both phases, square crossings, the time spent in each area, sniffing each restraining cage, rearing, grooming and wall climbing were measured. The results revealed that both the KO and WT mice preferred to be near a novel conspecific rather than to be alone; the magnitude of this effect was comparable in the two genotypes. Preference for a novel conspecific over a familiar conspecific was also seen in both groups, but only when the stimulus mouse was a preferred animal. When a non-preferred stimulus mouse was the novel animal, both groups showed a diminished novelty preference, but the magnitude of this effect varied by genotype. Under this condition, the WT mice showed a more pronounced negative reaction to the non-preferred mouse than did the KO mice. In addition, two other genotypic differences indicated that the KO mice may have been

more anxious than controls in these social encounters: (1) a greater proportion of the KO mice had high total grooming times; and (2) the average duration of nose contact with the stimulus mouse was significantly shorter for the KO mice than for controls. These results provide further support for the validity of this mouse model, although future studies are needed to more fully characterize the social behavior alterations in the fmr1 KO mouse.

title: "I contain multitudes": Chimeras, cells and the materialization of identities
abstract: This dissertation traces the biomedical networks through which human chimeras are clinically constituted. Chimeras are organisms in which two or more genetically distinct cell populations co-exist. Unlike their experimentally produced counterparts (often interspecies mixtures), human chimeras arise spontaneously when fraternal twin embryos fuse in the womb. While undoubtedly a rare occurrence, the true incidence is unknown because many chimeras have no visible signs of their composite being. Hence, chimeras are produced in an inadvertent encounter with the laboratory, during blood donation or tissue typing, for example. A subtype of chimerism, called microchimerism, occurs when the second cell population is tiny. The main context in which microchimerism is discussed in biomedical research is cell exchange between women and their fetuses, now thought to be a normal event during pregnancy. Human chimerism has existed since the 1950's, and microchimerism has become a research theme only in the last decade.
Like multiple personality disorder, conjoined twinning and organ transplantation, human chimerism troubles the connection between the individual and the body. Bodies, in these cases, are not neatly contained, which calls into question the inevitability and naturalness of singular embodiment. Chimerism, in particular, offers an analytical vantage point for the examination of genetics and identity in contemporary biomedicine. Using historical and ethnographic methods, and analytical tools from science & technology studies, this dissertation explores human chimerism and microchimerism. Interviews with scientists and careful analyses of published and unpublished literature reveals that biomedical researchers speak and write as though cells and people are interchangeable; not only do people contain cells, cells contain people. This tendency is an instantiation of genetic reductionism (we are our genomes), but it also refers to much older Western traditions wherein the material of the body is one and the same as the person. In chimerism, though, ascribing personal identity to cells leads to a confusion of the boundaries by which individuals are normally separated. While the location of personhood in cells is no doubt a reductionist tendency, the result - the fragmentation and interspersion of selves - leads to a provocative anti-reductionist conclusion: we all contain multitudes.National Science Foundation Award #0432120

title: Millimeter Wave Integrated Silicon Transceiver Design for High Data Rate Communications
abstract: With the explosion of information hungry computational and multimedia applications, the need for exceptionally high communication data rates has leapt to the forefront of electronic design. Advances is silicon technologies, manifested both in the speed of the transistors and complexity of the IC wiring stack, has bolstered the ability to meet new communication needs on a platform common to most consumer electronics. This ability becomes beneficial to historical approaches, both in system performance and costs, with the later being a huge benefit over existing solutions.
In this work the design of high speed wireless and wired communications on silicon platforms is investigated. The work uses both standard silicon CMOS technologies and silicon germanium BiCMOS technologies to demonstrate operations beyond 100 GHz and 100 GB/s. Activities in the wireless domain investigate both receivers and transmitters up to 100 GHz, with the most substantial work performed on the design and analysis of voltage controlled oscillators and low noise amplifiers. Differential and quadrature VCOs have been designed for operation between 16-64 GHz, with innovation in design methodologies and varactor

degeneration. LNA design has been performed for operation from 20-110 GHz, with emphasis on balanced/unbalanced operations. Wireline development has focused on the design of two parallel systems for operation beyond 80 GB/s and 120 GB/s. Parallel development of half-rate 4 to 1 multiplexers and 1 to 4 demultiplexers has been performed, as well as development of a 60 GB/s full rate flip-flop and 60 GHz static divider. Aggressive clocking techniques were developed to enable broadband operation from below 1 GB/s to the upper frequency bounds, and an area-centric design methodology was developed to mitigate the common perils of high frequency design.

Collectively, the circuits demonstrated here show a methodology aimed at enabling high frequency design despite the hurdles inherent in silicon processes. Most of these techniques are aimed at combating the limitations of the silicon substrate, even beyond the frequency limitations of the devices, and towards overcoming the amplified effects of interchip wiring at increased frequencies. In many instances the latter effects drive the electrical design of the circuits, where certain conventional techniques for high frequency design become impaired and undesirable.

title: Interfaces with the Ineffable
abstract: In recent years, Human Computer Interaction (HCI) designers and researchers have shifted focus from a primary concern with procedural, generic, and task based applications to applications that address messy, personal, and aesthetic experiences. These difficult to formalize experiences, such as feelings of intimacy, spirituality, or a sense of place, are conceptualized as experiences of the ineffable. In this work, I use a reflective design practice to look at two primary approaches to designing interfaces with the ineffable, one emphasizes reduction and the other openness to interpretation. I discuss issues of control and reification that result from the reduction approach and develop the interpretation approach as a viable alternative requiring a re-thinking design and evaluation strategies and criteria. These issues and approaches are explored in detail through the development of two case studies. Case study one addresses the ineffable experience of art and presents a series of applications for interfacing with the ineffable in the art museum. Case study two details the ineffable experience of affect and presents a system designed for augmenting affective presence in an office environment. To further this work, I examine new thinking in both HCI and Communication for understanding every day interpretive acts and the implications for design. In addition, I advance reflective design as a new process based practice for the field of Communication.

title: FUNCTION SITE OF SUPPLEMENTAL ESCHERIACHIA COLI PHYTASE IN THE GASTROINTESTINAL TRACTS AND ITS ROLE IN BONE METABOLISM OF YOUNG PIGS
abstract: This thesis consists of two studies on phytase. The objective of the first study was to determine the functional site of a supplemental Escherichia coli AppA2 phytase and its impact on digesta phosphorus and calcium concentrations in different segments of the gastrointestinal tract of pigs. In Exp. 1, 18 weanling pigs [8.3 ? 0.2 kg body weight (BW)] were allotted to three groups (n = 6) and fed a low-P (0.4%) corn-soy basal diet (BD), BD + phytase [500 units (U)/kg] or BD + inorganic P (0.1%) for 4 wk. In Exp. 2, 30 weanling pigs (14.5 ? 0.2 kg BW) were allotted to three groups (n = 10) and fed BD, BD + phytase (500 U/kg) or BD + phytase (2000 U/kg) for 2 wk. Five or six pigs out of each treatment group were slaughtered at the end of both trials to collect digesta from six segments of the digestive tract to assay for phytase activity, soluble P concentration, and(or) total P and Ca concentrations. Pigs fed BD + phytase had similar phytase activities in the stomach, duodenum, and upper jejunum digesta, and the detected activities were proportional to the supplemental levels of dietary AppA2. But, no phytase activity was detected in digesta of these three segments from pigs fed BD or BD + 0.1% iP or in digesta of lower jejunum and ileum from any of the treatment groups. Digesta soluble P decreased sharply from the stomach to duodenum of pigs fed BD + phytase or BD + iP, whereas it peaked in the upper jejunum of pigs fed BD. Colonic digesta phytase activity and soluble P were highest ($P < 0.05$) in pigs fed only BD and were inversely affected by dietary phytase supplementation. Pigs fed BD + phytase showed phytase-dose dependent reductions ($P < 0.05$) in total colonic P and (or) Ca concentrations, compared with those fed BD or BD + iP. In conclusion, supplemental dietary AppA2 mainly functioned in

the stomach, but remained fairly active in the upper jejunum. Colonic microbial phytase activity was greatly reduced by the supplemental phytase-mediated phytate-phosphorus hydrolysis in the fore segments of the digestive tract via substrate limitation. The objective of the second study was to determine if high levels of supplemental dietary microbial phytase, in a phosphorus (P)-adequate diet, additionally improved bone strength of growing female pigs. For three experiments a total of 80 pigs (28-35 d old) were fed a low-P (0.4%) corn-soy basal diet (BD), or BD + 0.2% or 0.25% inorganic P and (or) 1,000 or 2,000 units E. coli AppA2 phytase/kg for 4-6 wk. At the end of the experiments, pigs were slaughtered to collect 3rd and 4th metacarpals from front legs to test for bone strength. In Exp. 3, metacarpals were analyzed for their contents of Ca, P and other minerals. Weekly growth performance, plasma alkaline phosphatase activity and plasma inorganic P, were improved by phytase and inorganic P in BD. While these measures were not further improved by supplementing phytase at 2,000 U/kg in the P-adequate diets, bone strength of pigs fed the additional phytase was 12% ($P < 0.05$) greater than that of those fed only the P-adequate diets. The additional 2,000 U/kg in the P-adequate diets did not affect bone concentrations of Ca, P, K, Na, S, Mg, Fe, Mn, Zn, B or Cr, but resulted in 7% ($P < 0.05$) increase in bone Sr concentration. In conclusion, supplementing phytase at 2,000 U/kg of the P-adequate diets produced additional benefit on bone strength of young female pigs, and the improvement was not directly associated with P accretion.
In summary, the two studies reported in this thesis help in locating the functional site of E. coli AppA2 phytase in the digestive tract of young pigs, in unveiling a novel role of high levels of AppA2 activity in bone metabolism of young pigs.

title: Presenting Archaeology to the American Public Through Documentary Film
abstract: While feature films such as the Indiana Jones and Lara Croft: Tomb Raider series have popularized the field of archaeology, they are hardly useful for providing an accurate and educational depiction of the practice of archaeology itself. Yet archaeological research provides an often underrated, outstanding way of deriving information about the past that may or may not be known otherwise.In light of ?Hollywoodized? films, which largely present a romanticized, unrealistic view of the true practice of archaeology, one may wonder if more true-to-life visual depictions of archaeological research do exist. Accordingly, this manuscript seeks to analyze the availability of archaeology-related documentary films to the public, with a focus on audiences in the United States. How substantial is the availability of archaeology films to the general public? Or are such films restricted to academic institutions and scholars? What about age-range considerations? Are most films directed towards children, or a more adult audience? What type of language is used in presenting archaeology to the public through film? Are films geared ? whether consciously or unconsciously ? towards a well-educated audience that would properly understand complex terminology? Or do films incorporate ?everyday language? to attract and inform a more educationally diverse population?
In considering documentaries produced by a number of different production companies, this thesis also aims to discuss social issues. For example, are societal differences and/or customs presented, or not presented, through the documentary medium?
In striving to answer the aforementioned questions, this thesis scrutinizes both archaeological research practices as well as filmmaking procedures. Ultimately, such evaluations conclude that archaeological research, excavation, and interpretation enables one to learn not only about the archaeological findings themselves, but often also leads towards the incorporation and presentation of other related facets. In a case study of the archaeological work performed at Robert H. Treman State Park, archaeological research, excavation, and interpretation has enabled scholars, park employees, visitors, and others to learn more about the history of the park itself ? a history that may have been lost had archaeology not been a factor. Furthermore, such

research initiatives have also made possible an installation of an outdoor walking exhibit of the multiple archaeological sites within the park and work performed thereon. Accordingly, the archaeology chapter of the accompanying DVD, entitled Past, Present, Future: an Introduction to Robert H. Treman State Park, serves as an example of an archaeology-based documentary film. The DVD as a whole further supports the notion that archaeological research often leads to the presentation of other related aspects.

title: Sequence of Bloom of Perennials, Biennials, and BulbsIncluding Height and Color Range
abstract: August 10, 2006 Errata:

On page 8 Lythrum salicaria is listed for use in the Home Garden. Since this publication was printed, this plant, Purple Loosestrife has become an invasive species in New York. Please disregard this reference and do not encourage the growth of Lythrum salicaria.This popular information bulletin for the home gardener, will help you select and situate those perennials and bulbuous plants for a continuous display of bloom from early spring until the killing frosts of autumn. The list of perennials is limited to those that are generally hardy.

An average height is given so that gardeners unfamiliar with certain species will know whether the plants are low growing and belong in the foreground or are tall and should be planted in the background. Nearly 300 species with information about color, period of bloom, and plant height are covered. An essential guide for planning gardens of maximum beauty.

title: Physiological Nitrogen Isotopic Responses in Paracoccus denitrificans
abstract: The natural abundances of stable isotopes in our environment serve as intrinsic tracers that are incorporated into biological compounds and create unique isotopic signatures that record molecular history. Use of stable isotopes in the investigation of biochemical, geological, and forensic applications has become increasingly popular in the past two decades, in large part due to the recent development of requisite instrumentation capable of measuring the subtle variations of naturally occurring isotope ratios. Progress towards a universal model describing the behavior of isotopes in physiology has seen little consolidation due to the empirical nature of isotopic response. Elucidation of underlying mechanisms requires tightly controlled experiments with careful isotopic characterization of specific physiological states.
We exploit the environmentally-relevant and nutritionally versatile bacteria, Paracoccus denitrificans, to assess the fractionation of nitrogen in the metabolism of amino acids as a means to deduce physiological state. The manipulation of respiratory state and osmotic stress yields distinctive distributions of relative isotopic enrichment which is indicative of changes in metabolic pathways. We report the first in vivo position-specific measurement of the poly-nitrogenous amino acid, Lysine, and note a dramatic deviation in isotope ratios between sidechain and peptide nitrogen, which is correlated with respiratory state. In aerobic cells, the lysine intramolecular delta-delta-15N was negligible, but in anaerobic cells it was a remarkable delta-delta-15N = +11.0 permil, driven predominantly by enrichment at the peptide N. With regard to osmotic stress, we report a linear response with salt concentration in nitrogen isotope ratios of several amino acids, indicating an isotopic enrichment in amino acids which exhibit known osmoprotective properties. Bulk 15N/14N increased by delta-delta-15N = +5.603 ? 0.79 permil from 1% to 1.75% NaCl and significant linear trends of delta-delta-15N values with salt concentration between 1% and 1.75% ($p<0.05$) were found for five amino acids, Ala (delta-delta-15N = 4.66 ? 0.23 permil), Gly (delta-delta-15N = 4.03 ? 0.84 permil), Val (delta-delta-15N = 3.59 ? 0.32 permil), Pro (delta-delta-15N = 6.13 ? 0.76 permil), and Asx (delta-delta-15N = 5.27 ? 0.56 permil). These findings illustrate the sensitivity of isotope ratios in amino acids to physiological state and establish a premise for diagnostic techniques to assess metabolism.

title: Two Coupled Oscillator Models: The Millennium Bridge and The Chimera State
abstract: Cornell University PhD Dissertation
Theoretical and Applied MechanicsEnsembles of coupled oscillators have been seen to produce remarkable and unexpected phenomena in a wide variety of applications. Here we present two mathematical models of such oscillators. The first model is applied to the case of London's Millennium Bridge, which underwent unexpected lateral vibration due to pedestrian synchronization on opening day in 2000. The second model analyzes a new mode of collective behavior observed for a ring of nonlocally coupled phase oscillators.NSF - National Science Foundation

title: Synthesis and Reactivity of the Bis(phenylimino)pyridine Iron Bis(dinitrogen) Complex: Catalyst Deactivation Via Arene Coordination
abstract: In pursuit of highly active iron-based catalysts for bond-forming reactions, the phenyl-substituted bis(phenylimino)pyridine iron bis(dinitrogen) complex, (iPrPhPDI)Fe(N2)2 (iPrPhPDI = 2,6-(2,6-(CHMe2)2C6H3N=CC6H5)2C5H3N), was prepared by sodium amalgam reduction of the ferrous dichloride precursor under four atmospheres of dinitrogen. The bis(dinitrogen) compound displayed catalytic productivity for the hydrogenation and hydrosilation of 1-hexene superior to that of the methyl-substituted analog, (iPrPDI)Fe(N2)2 (iPrPDI = 2,6-(2,6-(CHMe2)2C6H3N=CCH3)2C5H3N). However, the catalytic productivity with more hindered substrates, such as cyclohexene and (R)-(+)-limonene, was inferior. The diminished catalytic productivity with these substrates precipitated from competitive deactivation via irreversible formation of n6-aryl and -phenyl complexes unobserved in the chemistry of (iPrPDI)Fe(N2)2. Dissolution of (iPrPhPDI)Fe(N2)2 in coordinating solvents such as THF or cyclohexene prompted exclusive formation of the n6-phenyl derivative, whereas dissolution in non-coordinating solvents such as pentane, ether, and mesitylene afforded solely the n6-aryl compound.
A family of bis(imino)pyridine ligands bearing alkylimino-substituents (rather than arylimino-substituents) was also synthesized and complexed to ferrous dibromide. Conversion to the corresponding dicarbonyl compounds was affected by sodium amalgam reduction under four atmospheres of carbon monoxide. Electronic studies of these alkylimino-substituted bis(imino)pyridine iron dicarbonyls demonstrated the electron-donating character of the ligands relative to their arylimino-substituted counterparts. Initial attempts to isolate effective precatalysts for C-H bond-forming reactions bearing the alkylimino-substituted bis(imino)pyridine ligand were unsuccessful. However, through the course of these attempts, a new precatalyst bearing the arylimino-substituted EtPDI ligand (EtPDI = (2,6-(2,6-Et2C6H3N=CMe)2C5H3N) was isolated by sodium amalgam reduction in the presence of excess 1,3-butadiene. The catalytic productivity of this butadiene complex for hydrogenation of simple olefins was assayed. An induction period was identified, and its origins examined.

title: The Selection, Care, and Use of Plants in the Home
abstract: A carefully selected, well located, and well-cared-for plant is an important item in any d?cor. However, because indoor plants are out of their natural habitats and are confined in containers, optimum growth is difficult. This publication discusses growth requirements, including light intensity, temperature, humidity,

watering practices, nutrient and fertilizing practices, potting mixtures, general maintenance, and correcting common problems, to help your plants flourish. A separate sections lists popular plants by light requirements, while another section focuses on decorative uses, including choosing containers for effective display. A final chapter deals with care of flowering plants. Dozens of black and white photographs, a diagnostic table for managing common problems supplement this helpful and informative text.

title: Video Play Pathways for Females: Developing Theory
abstract: ABSTRACT
This study explores the diversity of females in the realm of video games. Previous studies have focused on the differences between males and females in order to understand the dearth of female gamers. However, these studies have failed to acknowledge that even among subjects of the same gender, great diversity can, and does, exist. For this reason, the research contained herein will focus solely on females; trying to understand what sets female gamers (for they do exist) apart from female non-gamers.

The main question guiding this thesis is; ?How do female gamers and non-gamers differ in their perceptions of and engagements with video games?? That is, how do members of each group (gamer vs. non-gamer) tend to define videogames? How and why do they interact with them (for social reasons, for the challenge, to relieve boredom, because they are conveniently available, etc.) if they interact with them at all? How do their videogame experiences relate to childhood experiences, non-game interests/skills, and social climate if there is any correlation at all?

The project sought out women who have set themselves apart by participating in game-related activities (the Cornell Dance Dance Revolution Club and the Game Design Initiative at Cornell) and compared their experiences and opinions to those of women who neither participate in these activities nor would consider themselves ?gamers? in any other way. Some of these non-gamers were found among participants in a pilot study. Others were found within COMM201?an undergraduate communication class. In-depth one-on-one interviews provided the data that helps us to see the complexity of the female game experience.

Results of the study indicate that the dearth of female gamers may be tied to social factors more than the psychological ones some scholars have proposed. At younger ages, females seem to generally enjoy video games and other recreational technologies however, with maturity and gender socialization come a mindset that ?women don?t play video games?. In order to overcome the gaming gender gap, it may be necessary to change the way we as researchers think about games in order to change the way that women think about them. Furthermore, in order to advance the field of video game research, it may be necessary to question some popular assumptions, and press for standardized definitions of the major terminology.

title: Motivated Visual Perception: How We See What We Want To See
abstract: In 2001, a U.S. nuclear submarine surfaced underneath a Japanese fishing vessel, causing it to sink-9 died. In 1999, 41 bullets fired by 4 New York police officers hit and killed Amidou Diallo, who pulled from his pocket a wallet rather than what the police thought was a gun. In both tragedies, one might ask how these central actors could have failed to see what was plainly visible. With this work, I ask how perceptual systems represent the surrounding world if not in a veridical manner. I propose that the perceptual representations of which perceivers are consciously aware are colored by nonconscious motivational forces. Motivations, including wishes, dissonance reduction, and visceral needs, bias visual perception.

Three streams of research examined the ways in which motivations constrain perceptual processing. The first stream demonstrated that people's wishes biased the resolution of visual ambiguity. In 5 studies, participants shown an ambiguous visual figure reported seeing the desired interpretation. This finding was affirmed by unobtrusive and implicit measures of perception including eyetracking, lexical decision response times, and experimental manipulations.

In the second stream, I explored whether the motivation to reduce cognitive dissonance biased perception

and assisted in the regulation of psychological states. In 2 studies, participants performed an aversive task under high or low choice conditions. Participants saw components of their environment in less extreme ways in order to reduce dissonance. Those experiencing high choice perceived distances to travel as shorter and slopes to climb as shallower.

In the third stream, 5 studies showed that desires such as hunger, thirst, and general preferences led to a narrowed focus of attention on a desired object. Narrowly focusing attention reduced estimates of distance. Participants saw desired objects as closer than less desired objects.

I end by discussing the implications for marketing, self-screening in early cancer detection and relationship satisfaction among other applied domains. This work explores the limits of motivations, testing whether they cross the boundary separating how people think about their world and how they see it.The research in Chapters 2, 3, and 4 was supported financially by National Institute of Mental Health Grant RO1 56072, awarded to David Dunning.

title: A Detailed Analysis Of The Premium Variation In The Market For Medicare Supplemental Insurance
abstract: Medicare guarantees health insurance coverage for any person 65 or older. However, Medicare coverage is not complete and the additional costs are substantial: for example, the hospital deductible for part A is $956 and the part B deductible amounts to $123 in 2006. The elderly can insure against these financial risks by obtaining supplemental insurance from different sources. A private market designed to cover the "gaps" in Medicare is known as the "Medigap" market. This market is regulated since 1992 by the Omnibus Budget Reconciliation Act of 1990. The law created markets with homogenous goods mainly by standardizing the policies that could be offered. Economic theory predicts that in a market for homogenous goods, there should be little or no price variation. However, premiums of Medigap policies continue to vary even within narrowly defined markets.

This dissertation is concerned with finding economic explanations for this puzzle. Sources of premium variation in the Medigap market are empirically investigated as well as reasons for why premium variation is sustained. Chapter one provides a general overview of the Medigap market and points out specific peculiarities due to the Omnibus Budget Reconciliation Act of 1990. In the second chapter, which is joint work with Nicole Maestas and Dana Goldman, differences in the populations covered by insurance firms are investigated with respect to their impact on actuarially fair premiums. The third chapter focuses on how firms set prices for specific components of Medigap premiums and how these change over time. Also, the degree to which firm and state specific variables explain premium variation is investigated. The fourth chapter (joint with Nicole Maestas and Dana Goldman) targets the consumer side of the Medigap market by estimating a structural model that allows for sustained price variation due to consumer search costs.

The findings in this dissertation suggest that premium variation is at least partially caused by firm specific differences The premium variation is sustained through consumer search costs and thus uninformed

consumers. However, there are some indications that the market experienced an increase in competition that reduces premium variation.

title: Distributed Cooperative Communication in Large-Scale Wireless Networks
abstract: Cooperative communication employs distributed transmission resources at the physical layer as a single radio with spatial diversity in order to increase the performance of wireless networks. However, node cooperation entails large communication overhead, and distributed protocols that eliminate or reduce the communication overhead are desirable. This dissertation proposes distributed cooperative schemes for wireless ad hoc networks and develops new methods to analyze their performance.

First, we study the behavior of distributed cooperative transmission in wireless networks for both point-to-point and broadcasting scenarios. In particular, we analyze the effect of critical network parameters on the number of nodes reached by cooperative transmission. We show that there exists a phase transition in the network behavior: if the decoding threshold is below a critical value, the message is delivered to the intended recipient(s). Otherwise, only a fraction of the nodes is reached. Our approach is based on the idea of continuum approximation, which yields closed-form expressions that are accurate when the network density is high.

We next study the optimal power allocation problem for the cooperative broadcast in dense large-scale networks. The transmission order (schedule) and the transmission powers of the relays are designed so that the message reaches the entire network with the minimum possible total power consumption. In general, finding the best scheduling in cooperative broadcast is known to be an NP-complete problem. We show that the optimal scheduling problem can be solved for dense networks, which can be expressed as a continuum of nodes.

Finally, we study the design of distributed space-time codes for cooperative communication. With few exceptions, most of the literature on the subject proposes coding rules such that either inter-node communication or a central control unit is required for code assignment. We introduce novel randomized strategies that decentralize the transmission of a space time code from a set of distributed relays. Our simple idea is to let each node transmit an independent random linear combination of the codewords that would have been transmitted by all the elements of a multi-antenna system. We show that the proposed scheme achieves the optimal diversity order.

title: Investigating the Biosynthesis of Thio-Quinolobactin and the Development of a Proteomics Probe for Thiamin Utilizing Enzymes
abstract: Quinolobactin, 8-hydroxy-4-methoxy-quinaldic acid, is a siderophore produced by P. fluorescens ATCC 17400. A tryptophan catabolite, quinolobactin is isolated as the thio-carboxylate, referred to as thio-quinolobactin. The biosynthesis of thio-quinolobactin appears to combine two pathways that have been studied previously in the Begley laboratory. The first half of the pathway catabolizes tryptophan to 3-hydroxykynurenine and appears to require similar enzymes to those found in the biosynthesis of nicotinamide. The latter half of the pathway incorporates sulfur into the quinolobactin molecule as a thio-carboxylate. The enzymes responsible for the sulfur transfer are highly similar to those found in sulfur transfer in thiamin in B. subtilis and cysteine in M. tuberculosis.

We have identified activities for the proteins in the pathway that are responsible for the transformation of

3-hydroxykynurenine, the point at which this pathway diverges from that of nicotinamide biosynthesis, to quinolobactin. QbsB, a hydroxykynurenine aminotransferase, is responsible for the deamination and cyclization of 3-hydroxykynurenine to xanthurenic acid. QbsL then methylates the 4-hydroxy position of xanthurenic acid, and also activates the carboxylate as the acyl adenylate. Although we have not characterized sulfur transfer to quinolobactin to form thio-quinolobactin, we have identified roles for the putative sulfur transfer proteins QbsC, QbsD, and QbsE. QbsE is a small sulfur carrier protein that likely delivers sulfur to quinolobactin. Before the C-terminus of QbsE is activated as the thiocarboxylate, the two amino acids at the C-terminus following the diglycine are hydrolyzed by QbsD. This diglycine C-terminus can be adenylated and sulfurylated by QbsC, forming the thio-carboxylate.
In another project, we have synthesized and tested thiamin analogs incorporating a photo-labile substituent as proteomics probes. Thiamin pyrophosphate is an essential cofactor utilized by proteins in key prokaryotic and eukaryotic metabolic pathways. The ability to observe and compare relative amounts of these proteins when cells are grown under different conditions gives valuable insight into how cells respond to stressors. A promising probe was successfully synthesized and did exhibit the desirable properties of photo-lability and inhibition of thiamin pyrophosphate utilizing enzymes. Unfortunately, a high amount of non-specific labeling prevented it from being a useful proteome probe.

title: Radar and Airglow Studies of F-Region Composition and Dynamics at Low Latitudes
abstract: This thesis presents a series of studies investigating the composition and dynamics of the low latitude F-region ionosphere using airglow imagers and the Arecibo and Jicamarca incoherent scatter radars (ISRs), along with supporting instrumentation.

Some dynamical aspects of the low latitude ionosphere are investigated. The effects of a large-scale traveling ionospheric disturbance (TID) are studied. The TID characteristics are consistent with an atmospheric disturbance caused by high latitude Lorentz forcing associated with periodic substorms. Plasmaspheric coupling is necessary to explain the observed electron densities and airglow intensities.

Evidence is presented for post-midnight uplifts during which the low latitude ionosphere is lifted by tens of kilometers in mild events and by over a hundred kilometers in severe events. The uplifts are not caused by a reversal of the zonal electric field, instead occurring as a response to a decreasing westward field in conjunction with sufficient recombination and plasma flux. The midnight pressure bulge may play a role in the dynamics and the disturbance dynamo may enhance the uplifts.

The spectral properties of daytime penetration fields are analyzed using ground-based magnetometer data. The spectrum deviates from a power law under disturbed conditions, and the integrated power is a strong function of geomagnetic activity. The transfer function of the system is estimated using simultaneous interplanetary electric field data. Case studies support the notion of long-duration responses and of a weakly resonant system.

Models of the airglow emission rates are used to investigate the nighttime F-region ion composition. The intensities calculated including the molecular ions given by the International Reference Ionosphere (IRI) model

are much higher than measurements indicate, implying that IRI overestimates the molecular ion fraction. A revision of the IRI ion composition is needed, which could be constrained with airglow measurements. The neutral thermosphere over Arecibo is investigated using ion energy balance to estimate the neutral density and temperature. The so-called Burnside factor, associated with errors in the O+/O collision cross section, is estimated. In contrast to ion momentum studies, which typically lead to a Burnside factor greater than one, ion energy balance studies tend to result in low values for the Burnside factor. However, the ratio derived here is close to theoretical simulations of the collision cross section and may be a first step in reconciling the discrepancy between momentum and energy balance results.

title: DECOHESION OF GRAIN BOUNDARIES IN THREE-DIMENSIONAL STATISTICAL REPRESENTATIONS OF ALUMINUM POLYCRYSTALS
abstract: Since the 1950's, researchers have studied fatigue crack propagation utilizing fracture mechanics. Such work has provided advances in calculating stress intensity factors, determining elastic-plastic crack tip parameters, and investigating the effects of crack closure. Predictions of fatigue life have been made using crack growth rate models. Over the years, this work has served to influence structural maintenance and damage tolerance philosophies; however, understanding, predicting, and simulating fatigue crack growth is still based on experimental curve fitting and phenomenological rate ``laws."

The work discussed in this thesis is a step toward understanding fatigue crack incubation, nucleation and microstructurally small crack growth from a first principles approach. To this end, capabilities have been created and assembled to generate, mesh, analyze, and post-process 3D statistical representations of metallic polycrystals with cohesive grain boundaries. A component-based framework facilitates flexibility, growth, and multiscale modeling. Components are accessed and connected through Web service interfaces. The Polycrystal Generator accesses the components for generating, meshing, and assigning properties and boundary conditions to a 3D polycrystal sample. It also provides an interface to a molecular dynamics component to facilitate loosely coupled multi-scale analyses. Analyses are conducted utilizing a parallel solution software package, PETSc, and in-house finite element library, FemLib. The large samples and resulting data is managed using Microsoft SQL Server 2000, an off-the-shelf relation database. Finally, sample geometries, mesh models, and results are visualized using PView, a real-time visualization tool created using OpenDX, Python, and SQL.

The assembled framework is used to conduct a parametric study of 3D statistical polycrystals under monotonic loading. The samples are analyzed with variation introduced in geometry, grain constitutive model and parameter values, cohesive grain boundary parameter values, and boundary conditions. This parametric study gives insight into how each variation influences when and where cracks nucleate.

Finally, the results from the parametric study are utilized to conduct simulations under cyclic loading. These analyses give insight into the ability to accurately capture grain boundary decohesion leading to fatigue crack nucleation.

title: Highly Active Salen-Supported, Cobalt-Based Catalysts For The Synthesis of Regio- and Stereoregular Polycarbonates

abstract: Synthetic routes to new (salen)CoX (salen = N,N'-bis(salicylidene)-1,2-diaminoalkane; X = halide or carboxylate) epoxide/CO2 copolymerization catalysts are described, and the X-ray crystal structures of (R,R)-(salen-1)CoCl (2.4) and rac-(salen-1)CoI are presented. The (salen)CoX series are highly active catalysts for the alternating copolymerization of propylene oxide (PO) and CO2, yielding poly(propylene carbonate) (PPC) with no detectable propylene carbonate byproduct. The PPC generated using these catalyst systems is highly regioregular with 92 - 99% carbonate linkages and a narrow molecular weight distribution. Inclusion of organic-based, ionic or Lewis basic cocatalysts with (salen)CoX catalysts results in a remarkable activity enhancement for the copolymerization. In the case of (R,R)-(salen-1)CoOBzF5 (2.3) with [PPN][OBzF5] (3.1), an unprecedented catalytic activity exceeding 700 turnovers per hour is achieved for the copolymerization of rac-PO and CO2, yielding iso-enriched, regioregular PPC. When the rac-PO/CO2 copolymerization is carried out with catalyst system 2.3/[PPN]Cl at -20 C, a krel of 9.7 for (S)- over (R)-PO is observed. The stereochemistry of the monomer and catalyst used in the copolymerization has dramatic effects on catalytic activity and the PPC microstructure. Using catalyst (R,R)-(salen-1)CoBr (2.5) with (S)-PO/CO2 generates highly regioregular, isotactic PPC, whereas using (R)-PO/CO2 with the same catalyst gives an almost completely regiorandom copolymer. The rac-PO/CO2 copolymerization catalyzed by rac-(salen-1)CoBr (2.30) yields syndio-enriched PPC, a novel PPC microstructure.
The (salen)CoX systems are also successful catalysts for the alternating copolymerization of cyclohexene oxide (CHO) and CO2, yielding syndiotactic poly(cyclohexene carbonate) (PCHC), a previously unreported PCHC microstructure. Variation of the salen ligand and reaction conditions, as well as the inclusion of organic-based, ionic cocatalysts, has dramatic effects on the polymerization rate and the resultant PCHC tacticity. Catalyst rac-(salen-2)CoBr (4.6) has the highest activity for CHO/CO2 copolymerization, yielding syndiotactic PCHCs with 81% r-centered tetrads. Using Bernoullian statistical methods, PCHC tetrad and triad sequences were assigned in the 13C{1H} NMR spectra of these polymers in the carbonyl and methylene regions, respectively.

title: A MIXED METHODS EVALUATION OF AN AFTERSCHOOL SCIENCE CLUB'S INFLUENCE ON ADOLESCENT GIRLS' ATTITUDES TOWARD SCIENCE
abstract: Attitudes toward science have an impact on how and what students learn, which directly influences student achievement and student self perceptions (Cannon and Simpson 1985, Oliver and Simpson 1988, Simpson and Oliver, 1990). Attitudes have been shown to affect achievement scores and student self-concept (Peterson and Yaakobi 1980, Cannon and Simpson 1985, Oliver and Simpson 1988, Simpson and Oliver 1990). This study explores student attitudes toward science in grades seven and eight at a rural school district in Central New York. Attitudes toward science are defined as "a general and enduring positive or negative feeling about science" (Koballa, Crawley, 1985, p. 223). Attitudes toward science were measured at three different times during the school year for all students in grades seven and eight. A girls' science club intervention program was implemented for those in grades seven and eight who self-selected to participate. The club consisted of two treatments, one featuring hands-on activities and the other featuring career and role model guest speakers who were scientists. Through a switching replications design implemented at mid-year, all girls experienced both treatments. A mixed methods approach was used to collect both quantitative and qualitative data concerning attitudes over time for girls participating in the science club intervention program. Quantitative data was collected for students not participating in the club to provide data comparative data. Quantitative results indicated differences in attitudes over time for all students when data was pooled across grade levels. Additionally, grade level differences over time were observed in grades seven and eight, with grade seven showing an increase in scores over time and eighth graders showing a decrease in scores over time. No significant effects of gender were found, although there was a gender trend observed over time.
In the qualitative data, similar categories emerged over time in response to survey and interview questions. There were no major differences observed in survey responses from the beginning to the end of the year. No grade level differences were found in the categorical analysis of survey or interview responses. Qualitative data in some cases provided corroborating information in support of quantitative conclusions. In other cases, the qualitative data hinted at different conclusions.
This study found that the science club intervention program did not have a positive effect on girls' attitudes toward science. Factors beyond the intervention including the school environment and achievement expectations appeared to have more of an influence on attitudes than the intervention program. Further study is needed to determine if this phenomenon would occur in future cohorts of students and also to continue to evaluate the effectiveness of science programs in both formal and informal settings.NSF

title: Exploring Thallium Compounds, Chevrel Phases, and Other Chalcogenides as Thermoelectric Materials
abstract: In thermoelectric materials, the coupling between thermal and electrical currents allows for the direct conversion between heat and electricity. This makes possible the construction of refrigerators and electrical power generators with no moving parts which are compact, reliable, and vibration free. Devices made from the best materials for cooling near room temperature operate at only 10% of Carnot efficiency. This is significantly less efficient than a typical compressor based kitchen refrigerator, which operates at about 30% of the Carnot limit. Thermoelectric devices are currently used where the benefits of small size and/or dependability outweigh their cost in efficiency. It is clear that the development of widespread applications for thermoelectric devices must await the discovery of new materials with improved thermoelectric properties. In this dissertation, several experimental approaches to this problem are discussed. These include (1) new compounds containing the heavy element thallium, (2) the exploration of Chevrel phase materials for high temperature applications, (3) the search for new high symmetry materials, and (4) the chemical and physical manipulation of the properties of known thermoelectric materials. The investigations described in this work did not produce an improved thermoelectric material; however, they did lead to the discovery and characterization of many new compounds, some with interesting structural, electrical, and magnetic

properties.

abstract: Book of Hours is a stand-alone program that operates upon PocketPC-based handheld computers such as the Ipaq, HP Jornada, and Casio Cassiopeia. The Book of Hours critically comments upon the similarities between the medieval books of hours, which contained schedules of Catholic devotions, calendars of festivals and services, and collections of votive texts based around the High Medieval Marian cult, and shows these similarities to the PDA by turning it into a 'Book of Hours' for the Church of Technopoly. The program calls upon the similarity of the Book of Hours as a medieval PDA, and transposes this cultural structure to that of the handheld organizer. The program generates its own devotional 'hymn' and lush computer-generated illuminations based on information from the texts contained in the Book's data. Users are entreated to follow its daily schedule of rites, such as checking e-mail, making cell phone calls, tracking one's portfolio, and asks for the user to consult the Calendar of High Upgrades and System Scans. In addition, the user can read from devotional passages from the writings of Pope William I of Gates, and Bishop Stephen of Wozniak, and can enter their own passages, thus allowing the Book to modify itself to the user's style of interaction. The Book will hold all information on itself in a file in the PDA's memory, so it's use will be 'remembered' over time.

title: 2004 Rockefeller New Media Foundation Proposal
abstract: An evolving media archive of recorded conversations with incarcerated women, their families and communities, a website with an 800 number that will allow prisoners and the public to “call-in” by phone to record and publish their views on-line, a public graphics program, a public installation and live webcast “call-in” event that will allow incarcerated women to participate in public conversations, and record and publish their views, on imprisonment as a cultural and political solution to violence, addiction and poverty. The expansion of the prison system is buoyed by the ignorance of a majority of the public about what

imprisonment really means to individuals and communities. JustVoice will challenge the assumptions of mainstream society about crime and punishment that fuel a commitment to prisons as the primary solution to our most pressing social problems.

title: 2004 Rockefeller New Media Foundation Proposal
abstract: Guests, Parasites and Symbionts, is an interactive art and biology installation in which visitors will engage with live organisms derived from their own bodies and from those of other participants. Using the techniques of biology and medicine, the installation proposes to make visible these organisms and to create an engaging and provocative media environment for the interaction. It is based on what I already did in Protozoa Games. In this new version visitors will make physical contact with some device that will acquire their organisms. It then will provide for immersive sound, video, and animation events in which the flow of events are controlled by the interactions of the visitor's movements and gestures in the space (read by motion tracking technology) and the movements of the single cell organisms that are part of their body as made visible by a digital microscope. A projection screen will project their microorganisms situated as part of interactive digital animations and video created in Director. Another version of the installation will allow multiple visitors to engage with each other and each other's organisms and another version will let web visitors engage the protozoa.

title: The Technological Imaginary of Imperial Japan, 1931-1945
abstract: "Technology" has often served as a signifier of development, progress, and innovation in the narrative of Japan's transformation into an economic superpower. Few histories, however, treat technology as a system of power and mobilization. This dissertation examines an important shift in the discourse of technology in wartime Japan (1931-1945), a period usually viewed as anti-modern and anachronistic. I analyze how technology meant more than advanced machinery and infrastructure but included a subjective, ethical, and visionary element as well. For many elites, technology embodied certain ways of creative thinking, acting or being, as well as values of rationality, cooperation, and efficiency or visions of a society without ethnic or class conflict. By examining the thought and activities of the bureaucrat, Mori Hideoto, and the critic, Aikawa Haruki, I demonstrate that technology signified a wider system of social, cultural, and political mechanisms that incorporated the practical-political energies of the people for the construction of a "New Order in East Asia." Therefore, my dissertation is more broadly about how power operated ideologically under Japanese fascism in ways other than outright violence and repression that resonate with post-war "democratic" Japan and many modern capitalist societies as well.
This more subjective, immaterial sense of technology revealed a fundamental ambiguity at the heart of technology. While many elites encoded technology as the production of all aspects of life, some articulated technology as unexpected invention, transformative action, and creative self-formation. Such possibility

was found within the very technologies that systematically structured society. By examining the thought and activities of the philosopher, Nakai Masakazu, I illuminate another notion of technology as cultural practices of invention that tactically employed the technologies mobilizing everyday life. Thus, I also explore other notions of the political in a context where politics was increasingly incorporated into the wartime effort through technology.Japan-U.S. Educational Commission (Fulbright Commission) Cornell East Asia Program German Academic Exchange Service

title: Jihadism, International Society, and Interstate Cooperation
abstract: Why do states meet some terrorist threats through a collective effort, whereas at other times they respond separately, selecting from a variety of strategies? This dissertation advances an English School explanation arguing that the nature of the threat -- systemic or non-systemic -- posed by the terrorist entity accounts for the manner states respond: when a terrorist entity poses a threat only to the sovereignty and interests of specific states, countries will choose their policies from a range of available strategies. Interstate cooperation will be only one such option and, if taken, it is expected to be limited. However, when the terrorist challenge represents a threat to the existence of the state system, the members of the international society, under the leadership of its strongest powers, are expected to engage in a collective response at a level atypical of "normal politics." I test this theory using case studies, the prominent of which concerns the response to the al Qaeda-led jihadi movement.
The jihadis' ideology, their attitude toward the fundamental principles and institutions of the international

society, and approach to the use of weapons of mass destruction, render the global jihadi movement a threat to the international society. The nature of this threat became evident subsequent to 9/11 and led the international society, under the leadership of the American hegemony, to collectively rise to defend the state-based system. This collective action confirms and seeks to strengthen the primacy of the state in world politics. It relies on the principles of state sovereignty, states' mutual obligations, building state capacity and interstate cooperation, to fend off the jihadi threat while reinvigorating the international society. The operation of these four principles can be observed in the anti-terrorism financing regime, and the regime to deny non-state actors access to weapons of mass destruction. Together they are contributing to the creation of a worldwide infrastructure to combat the terrorist threat. This study also raises questions about state and religious logics as competing organizing principles for international relations, the role of hegemony in providing collective goods and U.S. foreign policies.

title: Secrecy and Anonymity in Interactive Systems
abstract: Kevin O'Neill's Ph.D. DissertationWhen building systems that guarantee confidentiality, system designers must first define confidentiality appropriately. Although researchers have proposed definitions of properties such as secrecy, anonymity, and privacy for a wide variety of system models, general definitions that are intuitive, widely applicable, and sufficiently formal have proven surprisingly elusive. The goal of this dissertation is to provide such a framework for systems that interact with multiple agents, emphasizing definitions of secrecy (to rule out unwanted information flows) and anonymity (to prevent observers from learning the identity of an agent who performs some action). The definitions of secrecy extend earlier definitions of secrecy and nondeducibility given by Shannon and Sutherland. Roughly speaking, one agent maintains secrecy with respect to another if the second agent cannot rule out any possibilities for the behavior or state of the first agent. These definitions are characterized syntactically,
using a modal logic of knowledge. Definitions of anonymity are given, with respect to agents, actions, and observers, and are also stated in terms of a modal logic of knowledge. The general framework is shown to handle probability and nondeterminism cleanly, and to be useful for reasoning about asynchronous systems as well as synchronous systems. It also suggests generalizations of secrecy and anonymity that may be useful for dealing with issues such as resource-bounded reasoning. Finally, the dissertation leverages these definitions of secrecy and formulates new strategy-based information-flow conditions for a simple imperative programming language that includes input and output operators. A soundness theorem demonstrates the feasibility of statically enforcing the security conditions via a simple type system.

title: Does Employment Empower Women? An Analysis of Employment and Women's Empowerment in India
abstract: This study explores the relationship between women?s empowerment and employment in India. The current rhetoric of women?s ?empowerment? in developing countries calls for greater participation and decision-making in the economic, political and social spheres. In the economic sphere, paid employment is seen as essential to women?s empowerment.
Research on the relationship between employment and empowerment often focuses on access to employment opportunities and working conditions at the societal level, and on a woman?s control over resources and

contribution to total family earnings in the household.

In Malhotra and Mather's (1997) analysis of the impact of education and work in women?s decision-making in Sri Lanka, a combination of survey data, focus groups and life histories are used to test the relationship between employment and empowerment. They find that education and employment are important determinants of women?s decision-making in terms of finances, but not in terms of household decisions related to social or organization matters. They conclude that research on the links between education and employment and empowerment must include broader measures of education and empowerment and incorporate a greater breadth of social, household and life course factors relevant to gender and family relations.

This study uses Demographic Health Survey (DHS) data from India to empirically analyze the link between labor force participation and women?s empowerment at the individual level for ever-married women age 15-49. Employment is unpacked and includes occupation and a number of employment characteristics to demonstrate important differences in outcomes for women?s empowerment across various aspects of what ?working? consists of. This study asks the question, when does employment empower women and when does it not, and in what ways?

In this study empowerment is measured across four indicators: decision-making, freedom of movement, control over resources and views on violence against women. Ordered logit models are used to first assess the relationship between employment status and women?s empowerment across the four empowerment indicators, and then to look at the association between various occupational classifications and empowerment. Subsequent models measure the relationship between employment and empowerment by looking at the interaction between occupation and who the respondent works for and then, in the fourth model specification, including women?s contribution to total family income.

The results of this study suggest that working is important to empowerment and that women who work have a greater likelihood of higher empowerment than those women that do not, but that the strength of the relationship varies by empowerment indicator. The findings of this analysis also reveal that women in certain occupations have a greater likelihood for empowerment and that various employment characteristics are associated with some of the indicators of empowerment. The author concludes that looking deeper into the employment experience and considering a broader range of empowerment indicators is important to developing a better understanding of the complex relationship between employment and empowerment.

title: The Metaphysics of Syntax in Nineteenth Century Lyric
abstract: Special Committee Chair: Jonathan Culler; Special Committee Members: James Eli Adams, John Bowers, and Peter Gilgen.This dissertation takes a new approach to the basic problem of literary criticism, the move from form to meaning, by rethinking the category of form through German Idealism and Chomskyan linguistics. My central methodological thesis is that we cannot develop a framework a priori and then apply it to particular cases, since such a procedure fails to read literary works in their particularity (and hence as literary), and I therefore approach issues in poetics and metaphysics from within interpretations of particular works, interpretations that do not form a unified narrative but rather a web of negative relations.
Chapter 1, on Hardy?s The Workbox, traces the shift from Plato?s alignment of form with the universal to Aristotle?s alignment of form with the particular. The Workbox traces the inverse trajectory in matter, revealing the convergence of universality and opacity in death. Chapter 2, on Keats?s To Autumn, focuses on the metaphysics of particularity and the particularity of literature, and introduces synthetic constructions as a way of understanding poetic ungrammaticality. To Autumn is concerned with the relation between a universal nature divinity and her particular manifestations, culminating in an inhuman pagan theodicy. Chapter 3, on Keats?s Ode to a Nightingale, presents a new theory of literary metaphors as synthetic constructions, in order to show that the ode deploys such constructions to think the experience of what is beyond experience. Chapter 4, on Browningss ?Childe Roland?, argues that Hegel's speculative transformation of Kant?s conception of objectivity has a terrifying underside that "Roland" explores, forcing us to re-think collectivity as requiring not only the mediation of the subject by objects but also by a (negatively) divine third term. Chapter 5, on Browning?s My Last Duchess, discusses the relationship between the verse line and syntax to show how the poem exploits the artifice of lineation to become a negative love poem, while Chapter 6 shows how Browning?s Karshish uses the negativity of lineation to rethink the theological, in line with Adorno?s Negative Dialektik, as neither a transcendent Absolute nor a pantheistic immanence, but rather as the immanence of the negative through which immanence exceeds itself.

title: Results in Computational Algebra of Bayesian Networks
abstract: This dissertation studies the algebraic varieties arising from the conditional independence statements of Bayesian networks. Reduction techniques are described for relating these varieties to the varieties for smaller Bayesian networks. Particular attention is paid to the issues of primality, dimension, and degree. A classification of 5-node Bayesian networks is given based on whether or not they are prime for all state vectors. A proof of the Degree-2 Conjecture is given for a subclass of Bayesian networks which includes those with binomial global Markov ideal.

title: Agriculture and Nanoscale Science and Engineering: A Case Study for Knowledge Translation and Risk Communication
abstract: Knowledge translation is a process and strategy that seeks to better connect knowledge producers

with knowledge users by involving the latter in the research process. This research explored the role knowledge translation could play in improving the communication between those who conduct nanoscale science and engineering (NSE) research and those agriculture stakeholders who may ultimately use some of the resulting applications. To accomplish this, I interviewed 20 scientists involved with NSE research from across Cornell to establish the varying understandings and applications of NSE, how scientists define risk in NSE, and what they think the public should know about NSE. I used the results from these interviews to generate a brochure on what NSE is and how it might relate to agriculture. To incorporate knowledge translation philosophy into the research, I then interviewed 17 agricultural stakeholders to discern their knowledge of and interest in NSE, identify their agricultural problems and understand their view of emerging technologies. Their input on the brochure content, layout and design was instrumental in appropriately contextualizing the brochure so it would be of use to the stakeholder audience. Finally, I used the combination of the interviews with the scientists and the stakeholders to understand the various perspectives on and perceptions of NSE and gain insight on how to communicate about an emerging technology. These results enabled me to identify challenges for future knowledge translation work and determine how (and if) scientists and stakeholders can more effectively share their knowledge.

title: BRANCHING RATIO MEASUREMENTS AND ISOSPIN ANALYSIS OF DECAYS OF THE D MESON TO TWO PIONS
abstract: Using 281 $\textrm{pb}^{-1}$ of data collected with the CLEO-c detector at the $\psi(3770)$ resonance, we measured branching fractions of the Cabibbo-suppressed decays $D^0 \to \pi^+ \pi^-$, $D^0 \to \pi^0 \pi^0$, and $D^+ \to \pi^+ \pi^0$. We used these branching fraction measurements to extract the ratio of isospin amplitudes $|A_2 / A_0| = 0.429\pm0.018\pm0.017$ and the relative phase $\delta = (85.5 \ pm 3.5 \pm 4.1)^{\circ}$ between these amplitudes, where the uncertainties are statistical and systematic, respectively. Our findings are consistent with, and lend support to the recently published official CLEO-c results.

title: 2004 Rockefeller New Media Foundation Proposal
abstract: Since 2002,1 collaborate with composer Chris Chafe, computer graphic (CG) artists Lorenzo Wang and Christine Liu, and with game theorist Jane McGonigal to create a simulation of human organs which unfolds in three media: print, recombinant cinema, and online gaming. The print version and recombinant cinema version premiere Oct 30, 2003 at the Berkeley Art Museum. I am seeking the support of the Program for Media Artists to complete the online Organum game. Organum plays in an online multi-player simulation

of a surreal ecosystem inhabited by a cast of organs, including a brain, a lung, and a stomach, and a set of AI (artificial intelligence) cyborgs. The game involves up to 32 people playing together in one session of Organum. The goal of the game is for players to stay alive in the fragile ecosystem as long as possible by ensuring the well-being of both themselves and their ecosystem. If successful, the community of players advances to a higher level of cultural achievement. Unsuccessful players drop out and have to join another game session.

title: PHYSIOLOGICAL AND MOLECULAR MECHANISMS OF HEAVY METAL TOLERANCE AND TRANSPORT IN THE HYPERACCUMULATOR PLANT SPECIES, THLASPI CAERULESCENS
abstract: Heavy metal pollution of the environment is significant problem throughout the world. One possible avenue for heavy metal decontamination of the environment is phytoremediation, which is a technology based on the remarkable abilities of certain plant species to tolerate and accumulate extremely high concentrations of heavy metals. One of the best known heavy metal hyperaccumulator plant species is Thlaspi caerulescens, which is a Zn/Cd-hyperaccumulator that can accumulate and tolerate up to 30,000 ppm Zn and 10,000 ppm Cd in the shoots without exhibiting toxicity symptoms. The research described in this dissertation focuses on identifying gene(s) that may be responsible for the extreme heavy metal accumulation phenotype in Thlaspi caerulescens.
In the research conducted here, it was demonstrated that xylem metal loading may play a key role in heavy metal hyperaccumulation. In initial studies, the influence of altered plant metal status on metal (Zn, Cd) accumulation in Thlaspi caerulescens showed that increased metal status stimulated subsequent heavy metal (Cd) accumulation in the shoots but not roots, suggesting that growth on high metal levels stimulates metal loading into the xylem. Subsequently, a heavy metal transporting P1B-type ATPase, TcHMA4, was cloned from Thlaspi caerulescens and shown to mediate cellular heavy metal efflux and tolerance when expressed in yeast. TcHMA4 is expressed primarily in the root vascular tissue and its expression is strongly upregulated upon exposure to high concentrations of heavy metals. These findings indicate that TcHMA4 may be responsible for metal xylem loading, and thus play a key role in the enhanced root to shoot metal translocation that is so important to hyperaccumulation. Furthermore, peptides derived from the C terminus of the TcHMA4 protein that harbor several heavy metal binding domains were shown to confer a significant increase in metal accumulation and tolerance when expressed in transgenic yeast (Saccharomyces cerevisiae) and plants (Arabidopsis thaliana). These findings indicate that the C terminus peptides have the capacity to serve as heavy metal binding ligands, and may be useful for enhancing the phytoremediation potential of plants via biotechnology.

title: Beethoven’s Political Music and the Idea of the Heroic Style
abstract: Beethoven?s works of state propaganda date from the years leading up to and during the Congress of Vienna in 1814?1815?although he composed this kind of music throughout his career. Over the last hundred and fifty years, critics have marginalized these political compositions to the extent that the politics pervading Beethoven?s oeuvre are barely audible. This study reemphasizes the political dimension of Beethoven?s music by articulating the aesthetic, stylistic, and ideological continuities between his canonical works and his maligned political compositions.
Chapter One explores the critical construction of Beethoven?s musical voice, which has come to be practically synonymous with what Romain Rolland dubbed the ?heroic style??the exhortative manner associated particularly with the odd-numbered symphonies from the Eroica onwards. It reveals the radically subtractive critical methods, encouraged in part by Beethoven himself, that sustain the perception of an ?authentically Beethovenian? sound, and shows how Beethoven?s political compositions suggest a more complex vision of the composer?s voice as fundamentally collaborative and plural.
Chapter Two examines the aesthetic assumption, supposedly instantiated by Beethoven?s heroic music and its immediate reception, that ?works? transcend their own time while mere ?occasional works? remain shackled to it. The aesthetic of heroic works such as the Eroica emerges as fundamentally ambivalent, constituted by a gesture in which political and historically localized meanings are ascribed to the music and withdrawn?much as Beethoven withdrew the initial dedication to Napoleon; meanwhile, works such as Wellingtons Sieg are shown to borrow the idealizing and transcendent rhetoric of contemporary aesthetics even as they articulate more overt connections to political figures and historical events.
Chapter Three shows how analysts consider Beethoven’s overtly political music to be organized by external political programs rather than internal musical processes. For many critics, Beethoven’s political works are mere collections of contingent and disjunctive moments?works that are almost formless without an explanatory political program. Nevertheless, analysts have often explained away precisely such moments in Beethoven?s canonical works?disjunctive moments particularly susceptible to poetic interpretation and political appropriation. Formalist critical approaches thus conceal the routes through which politics enter Beethoven?s heroic masterworks.

title: Understanding the Importance of Meal Delivery for the Well-Being of Frail Elders
abstract: Qualitative methods were used to explore the role of Meals on Wheels (MOW) in the lives of frail elders. This study explored the interface between the way MOW operates and clients' need to discover the ways that a meal intervention program integrates with existing lives, beliefs, and cultural values. A random sample of 20 MOW clients (3 receiving frozen meals) was interviewed in the Bronx, New York to obtain data on social contact, lifestyle, meal satisfaction, and eating patterns. General living conditions in clients? homes were observed. Transcribed text was analyzed and coded using Atlas.ti.

Most respondents expressed a desire to eat the meal hot upon arrival although it was delivered any time from 9:00 am-3:00 pm. Satisfaction with taste and perceived healthfulness of meals varied, but respondents were appreciative of the program and viewed the meals as important for their daily diet. One-quarter of the sample reported calling to ask for healthier meals or nutritional information for meals provided by MOW. When these requests were unsuccessful, respondents turned to a variety of remedies including boiling meals, rinsing off salt, removing high-fat sauces, giving meals to friends and neighbors, and throwing meals away.

Respondents usually did not know their driver?s name and exchanged few words when food was delivered, but this was often the only social contact respondents had during the weekdays. This frequent contact may play an important role in surveillance of elders? health and safety, and may also build personal relationships over time.

By accepting help from an organization such as MOW, which has a certain amount of institutional inflexibility, respondents both gained independence and experienced certain constraints on their schedules, social contacts, and ability to make culturally appropriate and personally preferred food choices. Given the importance of MOW for ensuring the food security and well-being of frail elderly, it is important to resolve some of the tensions created by MOW related to health and cultural issues.

There is no single meal plan that is appropriate for the entire diverse group of inner city elders participating in MOW. Respondents expressed a desire for healthier meals and meals specific to common health problems, as well as culturally appropriate meals, specifically for the growing population of Latino elders. In addition, alternative meal plans such as those that incorporate cooking education, grocery delivery, or frozen meals may be appropriate for certain groups of elders based on each client?s capability. In this study, capability was captured in two important dimensions: 1) Food Preparation and 2) Food Acquisition. Examining this type of capability provides valuable insight into the food management strategies of elders and may also be a promising new way to ascertain what type of meal plan is appropriate for each client.

title: Embedding, Distance Estimation and Object Location in Networks
abstract: Concurrent with numerous theoretical results on metric embeddings, a growing body of research in the networking community has studied the distance matrix defined by node-to-node latencies in the Internet, resulting in a number of recent approaches that approximately embed this distance matrix into low-dimensional Euclidean space. A fundamental distinction between the theoretical approaches to embeddings and this recent Internet-related work is that the latter operates under the additional constraint that it is only feasible to measure a linear number of node pairs, and typically in a highly structured way. Indeed, the most common framework here is a "beacon-based" approach: one randomly chooses a small number of nodes ('beacons') in the network, and each node measures its distance to these beacons only. Moreover,

beacon-based algorithms are also designed for the more basic problem of "triangulation", in which one uses the triangle inequality to infer the distances that have not been measured.
We give algorithms with provable performance guarantees for triangulation and embedding. We show that in addition to multiplicative error in the distances, performance guarantees for beacon-based algorithms typically must include a notion of "slack" -- a certain fraction of all distances may be arbitrarily distorted.
For arbitrary metrics, we give a beacon-based embedding algorithm that achieves constant distortion on a (1-epsilon)-fraction of distances; this provides some theoretical justification for the success of the recent networking algorithms, and forms an interesting contrast with lower bounds showing that it is not possible to embed all distances with constant distortion. For doubling metrics (which have been proposed as a reasonable abstraction of Internet latencies), we show that triangulation with a constant number of beacons can achieve multiplicative error (1+delta) on a (1-epsilon)-fraction of distances, for arbitrarily small constants epsilon, delta.
We extend these results in a number of directions: embeddings with slack that work for all epsilon at once; distributed algorithms for triangulation and embedding with low overhead on all participating nodes; distributed triangulation with guarantees for all node pairs; node-labeling problems for graphs and metrics; systems project on location-aware node selection in a large-scale distributed network.

title: THE SOIL/PLANT/PATHOGEN ASPECTS OF POTATO LATE BLIGHT
abstract: PhD DissertationOospores of Phytophthora infestans produced in vitro and in planta, were exposed to a variety of environments and their survival was assessed. Viability of oospores as measured by plasmolysis declined slightly over a period of 18 months whether they were stored in water at 4?C, in soil at 18?C, or in soil under natural field conditions. In comparison, viability as measured by germination was lower overall, but appeared to increase after storage in soil. Oospores produced in planta buried in the field were capable of infecting both tomato and potato leaflets when recovered after eighteen months, including two winters. Soil samples collected from the central highlands of Mexico (center of diversity for Phytophthora infestans) were evaluated for suppressive activity to P. infestans. A New York soil was used for comparative analysis. Even though both mating types are known to cohabit these regions of Mexico no evidence of oospores was found in the soil samples. No significant differences were observed between the Mexican and New York soils in terms of their influence on survival and infectivity of P. infestans. Bacterial diversity in the different soil types was investigated using terminal restriction fragment length polymorphism analysis (T-RFLPs). Foliar and tuber resistance to Phytophthora infestans were evaluated in a mapping population (n = 94) developed between two Solanum tuberosum breeding lines, NY121 x NY115. Foliar disease severity of the progeny clones was measured by the area under the disease progress curve (AUDPC) in field tests in 2004 and 2005. Correlation analysis of AUDPC values with amplified fragment length polymorphism (AFLP) molecular markers revealed that 56 %, 53 %, and 52 % of the quantitative phenotypic variance for resistance were associated with markers PCTMATC 184, PATMATA 171, and PATMACT 236, respectively, located on a chromosome V homolog derived from NY121 ($p < 0.00001$). The genetic component of tuber blight variance was much smaller than the foliar blight component, but still these three markers were correlated ($p < 0.01$? 0.10) with tuber blight resistance and explained 3-8 % of the variance.

title: RADIO FREQUENCY SIGNAL PROCESSING WITH MICROELECTROMECHANICAL RESONATING SYSTEMS
abstract: This thesis presents a study of the dynamics and applications of a high frequency micromechanical (MEMS) resonator. Mechanical systems, which have been scaled in dimension to the micron scale, show promise for replacing electrical resonant systems, which have larger physical size and lower performance. MEMS resonators can also be integrated into a chip containing conventional field effect transistors. A process incorporating both frequency dependent resonant systems as well as analog and digital electronics will enable all hardware in a communication architecture to be placed on a single silicon chip. In this study, a micron-sized circular membrane, suspended in the middle and clamped on the periphery, forms the basis of the resonant mechanical system. A small degree of curvature is fabricated into the resonator, which serves to stiffen the device and hence increase the frequency range. A microheater, defined in proximity to the resonator, is used to induce motion in the membrane. The frequency dependent response of the membrane is then detected through either interferometric or piezoresistive techniques.
Resistive actuation and detection allow the membrane and actuators to be fabricated into a single plane of silicon, facilitating integration of the complete MEMS system. It is demonstrated how both the resonators and transducers can be implemented into two CMOS processes. Both designs incorporate the mechanical system as well as the solid-state electronics for output signal detection into a single fabrication process.
Finally, the dynamics of the MEMS resonator, both in the linear and non-linear regime, are explored. The micron-sized mechanical system is demonstrated to perform several types of signal processing that are critical for wireless communication architectures. These studies shed new light on how the nonlinear dynamics of these systems may be characterized and harnessed for new applications.

title: Light Emitting Materials and Control of their Emission Properties for Applications in Integrated Optics
abstract: The field of nanophotonics has had numerous great achievements in the past few years. The scaling down of optical devices has created a need for active, light emitting materials whose properties need to be controlled for usage at such small scales. This dissertation presents results on the control of the emission of different light emitting materials. Chapter one presents a brief discussion of active materials for on-chip applications, what they are and their uses.
Chapter two deals with the enhancement of CdSe quantum dots embedded in a microcavity. After a brief overview of the density of photon modes and how enhancement can be achieved, the experimental details and results are presented, showing enhancement of the photoluminescence of the quantum dots by a factor of 2.7.
The third chapter discusses experiments with CdSe dots and resonant energy transfer. This effect involves a donor and an acceptor in close proximity, with the former "giving" its energy to the latter. The emission of the acceptor is further enhanced by making use of a microcavity, with a total enhancement by a factor of 13.
Experimental results on rare earth doped GaN in the form of a powder are presented in chapter four. This type of material presents highly luminescent properties, and offers the flexibility of being used in a hybrid manner (on silicon for example). Cathodoluminescence, photoluminescence and lifetime properties of various concentrations of RE dopants are discussed and presented, as well as a visible waveguide application of Eu doped GaN powder. Two temperature-sensitive changes in the lifetime behavior of Eu doped GaN occur at 104 and 195 K. The lifetime dynamics are studied in greater detail using a model with corresponding rate equations.
The last chapter shows applications of another class of a light emitting material: silica clad organic dyes.

These particles have a promising future in applications such as labeling and sensing.
Even though the materials studied here emit light in the visible portion of the spectrum, all of the experiments herein contained can be realized with their infrared counterparts.

title: Effects of Method of Delivery of Glycerol on Performance and Metabolism of Dairy Cows During the Transition Period
abstract: Thomas Overton; Michael Van Amburgh; Ynte Schukken Holstein cows (n=48) entering second or greater lactation were utilized to determine the effects of method of delivery of glycerol on performance and metabolism of dairy cows during the transition period. Beginning 21 d before expected parturition, cows were fed either a control diet or a diet containing glycerol (5% of DM). After parturition, cows were assigned to one of four treatments in a 2 (dietary glycerol; 3.3% of DM) X 2 (glycerol drench; 500 ml/d for 5 d beginning at parturition) factorial arrangement. From d 22 through 63 of lactation, cows were fed the same diet. Feeding glycerol during the prepartum period increased prepartum DMI, but feeding glycerol during the postpartum period tended to decrease postpartum DMI and drenching glycerol for the first 5 d of lactation decreased postpartum DMI. Milk yield was not affected by feeding glycerol during either the prepartum or postpartum periods or drenching glycerol during the first 5 d of lactation. Percentages and yields of milk fat and true protein were not affected by feeding glycerol during either the prepartum or postpartum periods; however, drenching glycerol tended to decrease milk protein content and decreased milk lactose content. Glycerol fed during the prepartum period resulted in no significant effects on plasma glucose, NEFA or BHBA concentrations during the prepartum period with no carry over effects on postpartum metabolites. Prepartum incorporation of glycerol in the diet resulted in no significant effects in liver triglycerides or glycogen content in liver samples collected d 1 after calving compared with control cows with no carry over effects on postpartum liver triglycerides or glycogen content. Postpartum incorporation of glycerol in the diet resulted in no significant effects on postpartum liver composition. Short term (5-d) oral drenching of glycerol beginning at calving resulted in no significant effects on liver composition (d 10 and 21 postpartum) or on plasma glucose and NEFA. However, there was a trend for an increase in BHBA concentrations for cows drenched with glycerol. Intensive blood sampling performed on d 5 post calving demonstrated that a 500 ml oral bolus of crude glycerine significantly decreased plasma NEFA concentration with no overall significant effects on plasma glucose, BHBA, or insulin. Overall, incorporation of glycerol in to the diets of transition cows or the short-term oral drench of glycerol at calving resulted in few positive performance responses and only modest effects on metabolic variables studied.West Central Soy

title: EFFECTS OF GROUND-WATER FLOW ON SOIL CHEMISTRY, NUTRIENT AVAILABILITY AND PLANT SPECIES DISTRIBUTIONS IN FOUR NEW YORK STATE FENS
abstract: Occurrence of distinctive plant communities, rich fens, in specific hydrogeologic settings with high fluxes of calcium-rich ground water has been observed but not fully explained. In fens, ground-water discharge patterns induce spatial gradients in water chemistry that may determine vegetation patterns through effects on nutrient availability. However, linkages among these components are poorly characterized. I hypothesized that transformations in carbonate (CO32?) chemistry along ground-water flowpaths (GWFs) would enhance carbonate precipitation, primarily due to redox reactions and carbon dioxide degassing. I

also expected phosphorus (P) co-precipitation would lead to P-limitation of plant growth and differences in species composition along the GWF.
I compared vegetation and hydrochemical gradients among four fens during 2002 with nested piezometers set parallel to GWFs. I found that local ground water influenced soil and water chemistry of the wetland edge, whereas GWF from larger-scaled systems influenced interior areas. Topography of the underlying mineral substrate and hydraulic conductivity of the peat controlled spatial distribution of ground-water effects on chemistry of the plant rooting zone. Spatial distribution of redox-sensitive ions (e.g., nitrate, iron, sulfate) and alkalinity conformed to GWFs. Equilibrium conditions prevailed with respect to calcium minerals except where ground-water inputs of sulfate induced SO42- -reduction and net dissolution predominated. Iron minerals, including siderite and iron-sulfides, also strongly influenced pore-water chemistry.
Sulfur content and bicarbonate-dithionite extractable P increased in areas with elevated alkalinity and evidence of SO42- reduction, suggesting that iron-sulfur reactions rather than CO32? chemistry regulate P dynamics. HCl-extractable P decreased in these areas, showing that P-co-precipitation with CO32?-minerals does not substantially affect P availability. Further, CO32?- minerals comprised less than 2% of the soil, except in marl fen (25%).
Non-parametric analyses of environmental and species data showed that position along GWFs significantly affected soil characteristics and plant communities. Spearman?s rank correlations revealed that multiple environmental variables, all associated with changes in pore water chemistry along the GWF, were highly correlated with plant species composition, indicating that GWF strongly influences plant species distribution. Autocorrelation among the predictor variables suggested that GWFs control distribution of plant communities through short-term effects on pore-water chemistry and long-term effects on soil chemistry.The Nature Conservancy, Garden Club of America, Sussman Foundation, Andrew W. title: Satan's Poetry: Fallen Art from Homer to Spenser in Paradise Lost
abstract: Special Committee Members: Winthrop Wetherbee III, Walter Cohen, William J. Kennedy, Kenneth GrossThis dissertation reconsiders Satan in Paradise Lost outside of the well-worn hero vs. fool debates by linking Satan's meaningfulness in the narrative directly to the conditions of meaning that underlie the poem. Because Satan is for Milton both the embodiment of fallenness and its cause, his journey through the poem demonstrates how the world in which Paradise Lost constructs itself comes to be. For this reason, "Satan's Poetry" argues that Satan's development in the poem underlies the poem's own development, providing us with a way to understand how the poem situates itself as a part of the fallen world and what it means for it to be thus fallen. The first chapter demonstrates that the language of poetry is the language of Satan, or fallen language more generally, and that this language is negatively constructed, a language of "enigmas" in the Adornian sense. By making this connection between Satan and Milton's poetics, this dissertation then goes on in the second and third chapters to rethink Paradise Lost's relation to its poetic tradition, arguing that this negative language produces negative relationships between individuals (human or poetic) in the fallen world. These relationships demand that we read allusion as the use of old words and images to mean something new, demonstrating Paradise Lost's distance from its predecessors rather than its proximity; reading in this way, as the second chapter demonstrates, allows us to read Milton's poem against multiple texts at once, rather than confining our readings to the linear model of influence relations. The third chapter argues that these differential relationships force us to rethink Milton's tradition not as a coherent whole or "canon" whose authority restricts subsequent literary endeavors, but as a constellation of specific relationships between individual texts that demands creation instead of repressing it. This turn to the creative individual

that is the result of the fall is, the final chapter argues, the crucial problem with which Paradise Lost grapples, and "Satan's Poetry" ends by demonstrating that the very negativity that is the symptom of fallenness also bears with it the promise of redemption.

title: INTEGRATED WATER RESOURCES ASSESSMENT AND MANAGEMENT IN A DROUGHT-PRONE WATERSHED IN THE ETHIOPIAN HIGHLANDS
abstract: Tammo S. Steenhuis,
Erick C.M. Fernandes,
Parfait M. Eloundou-EnyegueFood production shortfalls and accelerated land degradation are common in the semi-arid Ethiopian highlands. Both issues can be addressed to a significant extent by better water management. This dissertation presents four studies in eastern Amhara that examined effectiveness of a range of water management practices.

An on-farm study tested effectiveness of subsoiling, open and tied ridges, no till, and conventional maresha tillage to mitigate impact of dry spells on crops and to protect the soil. Tillage performance varied with seasonal rainfall distribution and intensity and land gradient. Ridges significantly increased soil moisture and grain yield and reduced soil loss. Subsoiling moderately increased grain yield and root growth, but led to higher soil loss than conventional tillage. No till minimized soil loss, but reduced yield during one season.

A second study measured plot and catchment hydrologic responses with and without conservation measures. Results show that severe erosion in the watershed occurred during few erratic storms rather than steadily across all seasons. Gently-sloped cropland generated over twice the seasonal runoff and sediment yield compared with steep rangeland. Plot runoff consistently exceeded catchment discharge demonstrating a scale effect. Catchment rehabilitation resulted in reduced peak discharge and longer duration streamflow compared to a catchment without these measures.

A third study examined hydrological and land cover changes in a wetland through remote sensing, hydrological measurements, rainfall records, and a residents? survey. All evidence indicated limited flooding and dense woody vegetation cover in the wetland 40 years ago and a trend towards current conditions of no living trees/bushes, extensive flooding, and heavy sedimentation. Results suggest changes are a consequence of increasing runoff from the catchment and higher population pressure that decreased potential of rainwater to infiltrate.

A fourth study surveyed households to assess what water resources they accessed and their water concerns. Each household relied on over 3 different water sources to assure daily supplies of 5-12 liters per person. Females assured most domestic water while male participation increased for livestock water and sources farther from home. Concerns included unhealthy water quality, unreliable year-round supply, and long up to 5 hours daily walking distances.The United States Environmental Protection Agency STAR Fellowship, Ford Foundation, Richard Bradfield Research Award, Mario Einaudi Center for International Studies Research Travel Grant, USAID-funded Amhara Micro-enterprise Agricultural Research and Extension and Watershed management (AMAREW) Project, Cornell International Institute for Food Agriculture and Development (CIIFAD)

title: MEASUREMENT SYSTEM FOR ULTRA-FAST PHENOMENA CONTAINED IN SLOW RELAXATION

PROCESSES
abstract: Ultra-fast transitions buried within long recovery times are difficult to measure and study directly. As an example, consider the spectroscopic measurement of a non-radiative upper level transition of a laser material possessing a long fluorescence time. The slow time constant of the overall relaxation process requires a pump with a low repetition rate. The speed of the transition in question requires an ultra-fast probe. It is difficult to obtain synchronous multi-wavelength pulses that satisfy both femtosecond duration and kilohertz repetition rates. We circumvent these issues by cavity dumping a femtosecond optical parametric oscillator. The signal is accessed at the appropriate rate to act as the pump, and the use of quasi-phase-matching provides synchronous sub-100 fs probe pulses at various wavelengths. We study the transient behavior of the singly-resonant optical parametric oscillator and develop a model to predict recovery profiles after loss events. Finally, we explore the feasibility of applying the new technique to Cr4+:YAG crystals to query the never before measured time constant of the 3E to 3B2 transition.

title: Algorithms for Mixture Models
abstract: Mixture models form one of the most fundamental classes of generative models for clustered data. Specific application examples include text classification problems, image segmentation and motion detection, collaborative filtering and many others. However, quite surprisingly, very little had been known about algorithms which have provable performance guarantees within the framework of mixture models. This is the topic we study in this work.
Our contribution is twofold. First, for the canonical problem of separating mixtures of continuous distributions in the high-dimensional Euclidean space, we provide the first algorithm that can learn distributions with heavy tails, including those with infinite variance and expectation. We formulate necessary conditions and provide an algorithm which guarantees that the underlying mixture model can be learned by observing only polynomially many samples. We also show that for many classes of distributions, our separation conditions are necessary for {\em any} algorithm which guarantees accurate reconstruction.
Second for the case of \emph{discrete mixture models} we give an efficient polynomial time algorithm with provable performance guarantees. Recasting of our algorithm for the text classification problem immediately results in a very fast unsupervised learning method, with an excellent classification accuracy.

title: Master's Thesis
abstract: Master's ThesisThis study attempted to test the impact of audience and medium on selfconcept change as a result of self-presentation. A 2 (public/private) X 2 (introversion/ extroversion assigned trait) X 2 (FTF/CMC) experiment was used to test the relationship between self-presentation and self-concept change in different contexts. The prediction of an enhanced effect of self-presentation on self-concept change in text based mediums as a result of selective self-presentation was not supported. Predictions regarding the impact of online audiences on self-concept change were also not supported. Instead, an unexpected finding, in which extrovert-assigned subjects internalized introversion in private text based conditions, was observed. This finding is discussed in terms of Schlenker?s four-factor theory of self-identification.

title: Changing Mindsets: Sustainable Design in Historic Preservation
abstract: At a time of rapid resource depletion and world population growth historic preservation rests at a pivotal point in the advancement of sustainable development and design. Historic preservation is inherently sustainable. Unfortunately, current green building practices focus more on the ever-growing technological innovations that can be applied to new construction. A lack of education and collaboration amongst historic preservation and sustainable design practitioners, scholarly research and publications that join the two fields, and building research, pose additional roadblocks in greening historic preservation in the United States.
The question is whether or not historic preservation and green building practice can effectively work together. They can and they do. The key to integration is the changing of mindsets. Educating industry stakeholders as to how and why this linkage can be made is a vital component to effectively taking green building and historic preservation to higher elevations of outreach and implementation. This paper investigates this statement in two ways, by [1] providing a theoretical and evolutionary framework of sustainable design and the inherent role that historic preservation plays within it, and [2] comparing the two sets of standards that guide the two practices: in historic preservation it is The Secretary of the Interior?s Standards for Rehabilitation and in green building it is the widely used Leadership in Energy and Environmental Design (LEED?) rating system.
The methodologies used to substantiate these points are varied. They include a literature review of sustainable development publications, a brief survey of the ?green? education of State Historic Preservation Officers (SHPO), an analysis of the LEED New Construction (NC) and Existing Building (EB) rating systems and their considerations of historic preservation, and a case study analysis of the green rehabilitation/renovation of the Jean Vollum Natural Capital Center in Portland, Oregon. Combined, this analysis proves that historic preservation is inherently sustainable in the most basic sense, and as a result lends itself to green building rating systems.
However, it also proves that there are many kinks to be worked out on both sides before a full integration is a reality. The rules and regulations surrounding The Secretary of the Interior?s Standards for Rehabilitation and LEED can be cumbersome, and this paper is a reminder that while both systems are worthy tools in the stewardship of natural and cultural resources, they are not hard and fast rules. They are basic guidelines, and the fusion of the two holds the potential to more closely align the fields of historic preservation and environmental conservation, and to allow the field of historic preservation to assert itself as a viable and integral means to promoting sustainability.

title: GIS Model paper
abstract: noneAbstract Identifying sites for economic development is the first requirement for any such project. Once the developer identifies a sight, then it is often a tedious and frustrating process to receive approval from the controlling municipal authority to develop the site, often complicated by the role of the local community impacting the decision process. The socio-economic factors may be the controlling factors on whether or not economic development can take place in a community. In this study, a Geographic Information System (GIS) model is developed that includes socio-economic constraints in addition to the normally used physical constraint factors in determining the potential for a specific site for development. The proposed model uses mathematical weighting factors to reflect community opinions for a selected set of socio-economic factors. The socio-economic factors are translated into mathematical values by using three dimensions: weight (or the level of importance), acceptability, and a distance factor. Once the physical constraints have identified accepted sites, then the socio-economic values are then overlaid on top of the physical constraint suitability map that then further restricts sites to those that are acceptable to the community based upon their own criteria that was used to develop the socio-constraint portion of the GIS model. The weighting and acceptability factors are developed from community input. These factors then combined with the distance factor, which is a quantitative fact result in site restrictions.
The model was applied to a community in Southampton, New York to demonstrate its utility in addressing community concerns over a potential development project. This community was debating whether or not to allow additional near shore aquaculture activity. The conventional GIS model, which determines the potential sites solely based upon using physical conditions, e.g., oxygen, salinity, temperature, water depth-- identified 4,338 ha of appropriate submerged land, but was reduced to 162 ha once the socio-economic factors were applied in the model. Another socio-economic data set was applied to the model to see the sensitivity of the factors that were being applied. The weights of the smell, hearing, and taste/ touch combined were raised (smell by 5, hearing by 1, and touch/taste by 3) while keeping other parameters the consistent with the first data set. The model then yielded 4,312 ha of submerged land with a negative suitability index, and only 23 ha of submerged land with a positive suitability index.
This study is one of the first attempts to incorporate surrounding community non-physical parameter variables when determining whether or not to allow further economic development for the local community. This model can act as a bridge between developers and the local community when political leaders make decisions relative to allowing development to be allowed.Faculty Committee members: Mike Timmons mbt3@cornell.edu Joe Francis jdf2@cornell.edu

title: An Empirical Analysis of Gender and Education in Brazil: The Differential Effects of Mothers and Fathers on Sons and Daughters
abstract: Amongst younger cohorts in Brazil, there is an educational gender gap that favors women. As such, this dissertation empirically analyzes several aspects and dimensions of the educational gender gap in Brazil. The primary focus is the effect of mothers' versus fathers' educational attainment, with a secondary focus on expected earnings gains. Each chapter is described below.

Chapter 2, "The Determinants of the Changing Educational Gender Gap in Brazil," analyzes the inter-temporal change in the educational gender gap by household type, focusing on the contribution of maternal and paternal education. The results indicate that the combined change (both returns and levels) in the education of household heads, fathers in two-parent households and mothers in female-headed households, has benefited sons more so than daughters, thereby reducing the gender disparity. In sharp contrast, the combined change in maternal education in two-parent households benefited girls more so than boys, widening the divide between sons and daughters.

Chapter 3, "Gender Differences in Brazil's Post-Compulsory School Attendance," examines school enrollment decisions, with an emphasis on the effects of maternal and paternal education. The empirical estimates show that for girls in two-parent households, maternal education has a stronger (more positive) effect on the probability of attending school than paternal education at low levels of parental schooling. At high levels of parental schooling, however, paternal education has more of an effect for girls than maternal education.

The fourth chapter, "Expected Earnings Gains and Eventual Educational Attainment: Gender Differences in Brazil," examines the role of gender differences in expected earnings gains on eventual attainment for adults. The empirical results show that expected earnings gains has a significantly stronger (more positive) effect for women than for men. Finally, simulations of equalizing gains increases the gender gap, but equalizing the coefficients on gains decreases the gender gap.

Overall, this dissertation provides an empirical analysis on gender and education in Brazil. Despite the existence of a reverse gender gap for several decades, there is very little research on educational differences between males and females. As such, this dissertation presents new information that can offer some insights into the source of the gender gap, as well as how it may change over time.

title: High-Energy Ultrafast Ytterbium Fiber Lasers
abstract: Within the past two decades, applications for sources of ultrafast pulses of optical radiation have expanded beyond the confines of research laboratories. Applications are too numerous to list in entirety but include uses in the fields of medicine, micromachining, high-bit-rate telecommunications, optical range-finding, and detection of trace chemicals to name a few. Currently, the market is dominated by femtosecond solid-state lasers due to their superior pulse energy and quality. However, many sources are being replaced with fiber-based lasers due to their inherent stability, compact design, and reduced cost.

This thesis summarizes research on femtosecond ytterbium-doped (Yb) fiber lasers operating in the near-infrared spectrum (~ 1-micron wavelength). There is strong interest for stable, femtosecond sources at this wavelength for biomedical imaging and noninvasive surgery. The overriding theme of this research is an attempt to better understand the limitations of short-pulse fiber lasers, with the goal of providing higher-energy, shorter-duration, and higher-quality optical pulses from fiber.

In the context of high energy, two approaches are reviewed. In the first approach, fiber nonlinearities are exploited through relatively new forms of pulse evolution which provide stable, high-power operation. In the second approach, excessive nonlinearity is avoided as much as possible, and high-energy pulse formation is

stabilized with an intra-cavity frequency filter. Experiments have successfully generated the highest pulse energy (3-times improvement), highest peak power (50% improvement), and highest average power from any fiber oscillator.

Also discussed is a new regime of modelocked operation in which highly-chirped pulses are relatively unchanged during propagation in the laser. While these pulses suffer some in quality, they can attain relatively high energy and can be de-chirped external to the laser, achieving durations of a few hundred femtoseconds.

A fiber laser is explored which is capable of generating ten-cycle pulses. By compensating for higher-order dispersion inside the oscillator, record pulse durations are generated with excellent pulse quality.

Finally, an experiment is discussed in which a fiber laser is modelocked with a semiconductor saturable absorber mirror (SESAM). Femtosecond durations are achieved. This laser represents a first step toward an environmentally stable source of high-energy, short pulses.

title: INTEGRATION OF CARBON AND SILICON BASED NANOELECTRONICS
abstract: Nonvolatile memory technology has shown tremendous technological progress in the recent years. With the need for every higher memory density, the EEPROM structure has been subjected to aggressive scaling. Currently 65 nm devices are hitting production where the floating gate has been replaced by nitride traps for continued scaling. However the operational voltage has not scaled as aggressively. In this dissertation, various different structural variations of the EEPROM have been explored from experimental and theoretical perspectives. The electrostatics of nanocrystal memories with both metal and semiconductor nanocrystals have been analytically modeled to demonstrate enhanced field asymmetry in the path of least action in tunneling oxide. The larger polarization of the metal nanocrystal versus a semiconductor nanocrystal has been used to explain faster programming for metal nanocrystal memories compared to the semiconductor nanocrystal variety. The analytical model provides design intuition unlike numerical models for structural optimization. To provide a solution for the size-dependent variation of coulomb blockade self-assembled nanocrystals, molecules have been suggested as nano-floating gates in non-volatile memory. Carbon molecules like fullerenes (C60) have been integrated in the MOS gate stack. Charge injection into molecular orbital has been observed as repeatable steps in electron injection versus charging voltage data to demonstrate a successful molecular interface with CMOS. Finally, an ultra-narrow channel memory device fashioned out of self ?assembled carbon nanotube (CNT) channel with self aligned metal nanocrystals is proposed as an alternative to memory scaling. The device demonstrates large memory window and single-electron sensitivity. The single electron sensitivity at room temperature is confirmed by analysis of the transport in the CNT channel using non-equilibrium Green?s function (NEGF) formalism. The large number of charges stored in the nanocrystal at sub-5V gate bias for the 100 nm gate stack is demonstrated experimentally and explained from the electrostatic analysis of the CNT-nanocrystal memory. The ability to store large number of charges per nanocrystal and the ability of sense each of these charge charges indicates the possibility of a multi-level memory, a way of enhancing functional density while relaxing conventional memory scaling constraints.NSF, NIRT, CNF, CNS

title: Aspects of Foraging in Bees: Apple Pollination, Native Bee Populations, and Honey Bee Communication
abstract: Bees are well known for their ability to pollinate a diverse range of plants. In the process of gathering food (pollen and nectar), bees transfer pollen from one flower to another, facilitating reproduction. I investigate two important aspects of foraging: pollination of an important crop by native bees and communication of floral resources by social bees.
Native bees that pollinate apples are an economically important and potentially limited resource. Native bees are often overlooked since orchard growers traditionally rely on managed honey bees for pollination. Given their potential to ameliorate the deficit of honey bee pollinators, it is important to identify the suite of apple pollinators in New York State, the life history of each native bee group in relation to apple pollination, and to promote their occurrence in and around apple orchards.
In order to facilitate visiting flowers, collecting nectar and pollen, and pollinating crops, honey bees have a language that conveys information from a recent foraging trip. This communication maximizes colony-level foraging efficiency and is achieved by a complex dance language. An interesting phenomenon in the dance language is the presence of distance-dependent error; precision increases as food-source distance increases. Here, I investigate three hypotheses for why there is imprecision within dances. Bees may be constrained, either physically or physiologically, to high precision for nearby food sources. Alternately, there may be an adaptive value to scattering recruits over a larger area.
Direction indicated within dances is gleaned from the sun?s azimuth, but the extent to which to sun's position influences the precision of dances is unclear. Here, I test the hypothesis that error encoded in dances changes throughout the day.
Through a series of seminal experiments, Karl von Frisch decoded the honey bee?s dance language. Since then, it has been widely accepted that there are two distinct types of dances: the round dance and the waggle dance and that they convey different information. Here I show that distance and direction information appears to be encoded in the same manner in both forms, suggesting that there is only one recruitment signal, the adjustable waggle dance.

title: An Examination of Deceptive Self-Presentation in Online Dating Profiles
abstract: Online dating profiles are a popular new tool for initiating romantic relationships, although recent research suggests that they may also be a fertile ground for deception. The present study examines the occurrence of lies in online dating profiles and examines deception through a variety of theoretical lenses (affordances and limitations of computer-mediated communication, relational goals, and individual differences between users). Results suggest that the deviations between participants? online self-presentations and the truth tended to be small but relatively frequent. This is consistent with the Hyperpersonal model?s

assertion that online communicators engage in strategic and selective self-presentation. Results also suggest that, when deciding what to lie about, users take into consideration both the technical affordances of online dating portals, such as the editability of profiles, as well as the more social aspects of online dating, such as warranting and relational goals. Methodologically, this study is innovative in that it objectively verifies the accuracy of participants? descriptions, in addition to asking them directly whether they have lied. This increases the reliability of the data, and allows for the first objectively obtained measure of deception in online dating profiles.

title: Studies on the Biosynthesis of Cysteine in Mycobacterium tuberculosis and Studies on the Biosynthesis of Vitamin B6 in Bacillus subtilis
abstract: Cysteine is one of the 22 natural amino acids used to make proteins. Three pathways are currently known for the biosynthesis of cysteine and all include sulfide as the sulfur source. A new pathway for cysteine biosynthesis was elucidated and reconstituted from Mycobacterium tuberculosis. This pathway involves a protein bound thiocarboxylate (CysO-SH) as the sulfide donor, similar to thiamin and molybdopterin biosynthesis. MoeZ, a paralog of ThiF (thiamin) and MoeB (molybdopterin), transfers sulfide onto CysO from an unidentified source. Cysteine synthase M (CysM) catalyzes the addition of O-acetylserine to the carboxy terminus of the protein bound thiocarboxylate to generate a CysO-cysteine adduct. A protease, Mec+, hydrolyzes the CysO-cysteine adduct to release cysteine and regenerate CysO. Mec+ contains the JAMM motif and this work provides the first functional characterization of the JAMM motif in prokaryotes. This pathway could be important for M. tuberculosis under conditions of oxidative stress, as it would provide a more stable source of sulfide than the traditional pathways for cysteine formation.
Vitamin B6, an essential cellular cofactor, is biosynthesized by bacteria and lower eukaryotes and is required in the human diet. Two de novo pathways for PLP biosynthesis were known, however, the most common pathway involving the YaaD and YaaE family of genes had not been reconstituted. The substrates for Bacillus subtilis PLP synthase (YaaD and YaaE) were identified as ribose-5-phosphate, glyceraldehyde-3-phosphate and glutamine; the product is pyridoxal-5?-phosphate. In addition to PLP formation, we identified three activities catalyzed by the YaaD subunit of PLP synthase, including ribosephosphate isomerase activity, triose phosphate isomerase activity, and adduct formation with ribulose-5-phosphate. We also investigated the early steps of the mechanism of pyridoxal-5?-phosphate formation. In the absence of triose, PLP synthase forms a stable intermediate which absorbs at 320nm. This intermediate then reacts with glyceraldehyde-3-phosphate to form PLP.

title: ENGINEERED 'GREEN' COMPOSITES USING KENAF AND BAMBOO FIBERS WITH MODIFIED SOY PROTEIN RESIN
abstract: In this thesis, fully ?green? composites using nonwoven kenaf mats and modified soy protein isolate (SPI) resin were fabricated. Moreover, fibrillated bamboo fiber (FBF) sheets were also incorporated into some kenaf mat composites to obtain engineered hybrid green composites. Potential mechanical properties of these cutting-edge materials have been proposed.

Initially, an appropriate SPI resin composition for optimal composite properties was determined by varying pH values and the amounts of glycerol, used as plasticizer. The final composition contained 10% glycerol (by wt. of SPI) and 11 pH. The effects of a self cross-linking Phytagel? on the tensile properties of the modified SPI resins were evaluated. The tensile strength and Young?s modulus of SPI resins showed a significant improvement by adding Phytagel?. The kenaf fiber/modified SPI resin interface was characterized using the single fiber fragmentation technique. The mechanical properties of these green composites fabricated with SPI modified with various percentages (0, 10, 20 and 40%) of Phytagel? (by wt. of SPI) were characterized. The tensile properties of the green composites didn?t increase significantly with the Phytagel? content. The flexural strength and chord modulus of the composites containing 20% Phytagel? in SPI resin were, however, 1.6 and 1.4 times higher than the composites with 0% Phytagel?, respectively. The composites with 40% Phytagel? in SPI resin possessed the highest impact strength.

The tensile strength and modulus of the hybrid composites using FBF sheets and SPI resin modified with 20% Phytagel? were 37.1 MPa and 2187 MPa, respectively, which represent a 10% and 20% improvement over the kenaf mat composites using the same resin. The impact strength of the kenaf mat composites improved 116% after incorporating FBF sheets.

title: Strategies for Clothing
abstract: This advanced unit of the ?4-H Clothing Project Series? expands further on the skills and knowledge learned in earlier programs, and prepares students for setting out on their own. Students will learn how to develop new ideas unique to their personalities. Creativity will be sparked, leadership skills will be honed, and volunteer opportunities will arise. Principles of design, fashion, clothes shopping, advanced fiber knowledge, tailoring, stain removal, care for accessories, skin care, hair coloring, posture, history, and interview preparation are covered along with many other topics. Upon completion of the curriculum, and sometimes much sooner, students will be able to develop their own unique ?Strategies for Clothing?, and apply their best thinking on many different levels as they enter adulthood.

title: Challenges in Clothing
abstract: This second unit in the ?4-H Clothing Project Series? builds on the knowledge and beginning sewing skills developed in ?Adventures in Clothing: Unit I?. The 8 chapters in this project book begin with discovering how line, color, and texture can keep you ?Looking Good?. You?ll learn to successfully coordinate

the outfits and accessories you wear. Whether you are buying or making clothes, the challenges in the ?Choosing Clothes? and ?Learning about Fabrics? chapters is to develop your consumer decision making skills. You?ll learn to make a wardrobe plan, and to evaluate the clothing choices you make. In the chapters about ?Creative Sewing? and ?Caring for Clothes?, your challenge is to grow in creativity, independence, and responsibility. In ?You and Others?, the challenge shifts to get beyond yourself and find how clothes affect your relationship with others.

title: Adventures in Clothing
abstract: The fist unit in the ?4-H Clothing Project Series? helps students develop basic knowledge about a broad spectrum of topics related to clothing and sewing. The basic science of color is introduced and broadened into color use and color effects in clothing. Design lines as related to fabric design, trims, seams, darts, and gatherings are explored. Clothing choice is introduced based on students? personal ?likes? or preferences, as well as needs. Fabrics are explored in terms of basic science, make-up, weave and finish. A longer chapter titled ?Creative Sewing? helps participants apply their new found knowledge with basic sewing skills in several step-by-step projects. Sewing machines, sewing tools use, hand sewing, sewing with and without patterns, body measurements, cutting, marking, and pressing are all covered. Clothing care, clothing safety, and personal pointers round out this wonderful curriculum.

title: Attentional dysfunction, impulsivity, and resistance to change in a mouse model of Fragile X syndromeImpaired arousal regulation in a mouse model of Fragile X syndromeAttentional dysfunction, impulsivity, and resistance to change in a mouse model of Fragile X syndrome
abstract: ATTENTION, AROUSAL REGULATION & INHIBITORY CONTROL IN FMR1 KNOCKOUT MICE: A MOUSE MODEL OF FRAGILE X SYNDROME

Ji-sook Moon, Ph.D.
Cornell University 2006

Fragile X syndrome (FXS) is the most common inherited form of mental retardation, occurring in roughly 1/4000 males and 1/8000 females. An abnormal expansion of a trinucleotide CGG repeat sequence in the fmr1 gene results in transcriptional silencing of this gene, which codes for the Fragile X Mental Retardation Protein (FMRP). The loss of FMRP, directly and/or indirectly, gives rise to the FXS phenotype, which includes a characteristic set of anatomic and cognitive/behavioral features. The present studies were designed to test the hallmark areas of dysfunction (i.e. attention, inhibitory control, hyperarousal, and emotional regulation) seen in human FXS and further characterize spared and impaired functions in fmr1 KO mice. The performance of F1 hybrid fmr1 KO mice (a C57BL/6J x FVB/NJ cross) and wild-type (WT) littermate controls were

evaluated on a series of tasks designed to assess inhibitory control and various aspects of attention, Reversal Learning Task, and Associate Learning Task. Regulation of arousal and emotion, two domains affected in FXS, was also evaluated in these tasks by examining the animals reaction to the unexpected presentation of potent olfactory distractors (in the Distraction task), as well as their reaction to committing an error on the previous trial.

The present studies provided the first evidence that the hallmark deficits in human FXS -- impaired attention, inhibitory control, and arousal regulation are also impaired in the fmr1 mouse model of FXS. In addition, these findings demonstrate that attentional dysfunction and impaired inhibitory control are most prominent when task contingencies change and when the animal has just committed an error situations that arouse or disturb the mice. Analysis of videotapes further demonstrates that arousal regulation is impaired in the fmr1 KO mice. Additionally, the fmr1 KO mice were not impaired in associative learning, transfer of learning, or reversal learning. The present results provide strong support for the validity of this animal model for future studies designed to elucidate the pathogenic process in human FXS and to test new therapies.

title: GOVERNING LITERACY: A CRITICAL DISCOURSE ANALYSIS OF THE UNITED NATIONS DECADES OF LITERACY, 1990-2000 AND 2003-2012
abstract: Using critical discourse analysis (CDA), this study examines constructs of literacy and literacy education embedded in policy documents related to the United Nations Decades of Literacy (1990-2000 and 2003-2012) and argues that two important shifts related to discourse occur between the policies. The first shift is manifest in the construction of literacy as a concept and reflects the rising influence of New Literacy Studies (NLS), a body of research that emphasizes the plural, contextual, "ideological" (Street, 1993) nature of literacy as social practice. The second shift is marked by the intensification of the discourse of "new capitalism" (Fairclough, 2003; Gee, Hull, & Lankshear, 1996), which focuses on the societalization of economic globalization. In the "interdiscursive" (Fairclough, 2003) relationship between these two shifts, the discourse of new capitalism circumscribes features of the emerging "ideological" constructs of literacy, steering the policy's agenda toward neo-liberalist ends. In clarifying discursive relationships in these influential policies, this study contributes to an emerging body of scholarship (see Street, 2003) that connects socio-cultural models of literacy to the discursive production of meaning in institutional literacy work.

title: Probabilistic Models for Operator Decision-Making in Intelligence, Surveillance, and Reconnaissance Type Scenarios
abstract: Master of Science Thesis, Aerospace Engineering, August 2006This thesis contains three papers related to modeling a Human in the Loop (HITL) operator interacting with a system of autonomous vehicles in Intelligence, Reconnaissance and Surveillance (ISR) type Scenarios. The thesis begins with an empirical study of one such actual system, moves to a narrow-scope detailed experimental software simulation introducing probabilistic models and culminates in experimental investigation using a time dependent information tracking function with a set of analytically tractable probabilistic models.

This first paper, entitled, ?Experimental Study of Information Load on Operators of Semi-Autonomous Systems? presents a set of experimental results studying the relationship between Human in the Loop performance and user workload in the RoboFlag test-bed. Operators played a series of games to evaluate

performance as a function of information load (speed and number of vehicles). Results showed a positive relationship between game speed and total score. In addition operators reported using more automation as number of robots increased but trusting automation less as game speed increased.

The second paper, entitled ?Modeling Tradeoffs in Decisions by Operators Controlling Autonomous Vehicles? presents the results of two decision-making experiments and two operator decision models for an Intelligence, Surveillance and Reconnaissance (ISR) type mission. The first experiment used 25 possible scenarios, each of which included enough trials to allow a formal statistical model to be derived. The distribution of operator decision data was modeled with a binomial distribution as a function of environmental variables. An optimal decision-making policy was also prescribed for all scenarios. Results show good agreement between operator data and the optimal decision-making policy in most scenarios, except when the relative utility between the choices was similar. Lower order probabilistic models using conditional probabilities and Gaussian random variables are also derived; results show a strong ability to use lower order models for operator decisions. The second experiment presented operators with the same binary decision, but from a more general choice of 90 possible scenarios. This allows the evaluation of the probabilistic model as data becomes sparse. Operator data from the second experiment was successfully binned and compared to the results of first experiment, demonstrating consistent operator decision-making between experiments.

The final paper, entitled ?Operator Decision Modeling for Intelligence, Surveillance and Reconnaissance Type Scenarios with a Time Dependent Information Function? presents a model of operator + vehicle interaction for a simplified Intelligence, Surveillance and Reconnaissance type mission utilizing a time dependent information function for target identification. The model is developed and evaluated using operator decision-making experiments where an operator controls a friendly uninhabited aerial vehicle (UAV) tasked with identifying enemy targets within a two-dimensional map. Operators must make two decisions: 1) which target to choose first, and 2) if and when to task the UAV to the second target to start data collection. Two sets of experimental data were collected. In all experimental scenarios, target choice and time on target were recorded. The data was analyzed in order to develop an analytically tractable model of operator choice. An optimal decision-making policy was also prescribed for all scenarios and compared to the operator data. Finally a both tabular and lower order probabilistic model developed to model decision making in this experiment.

title: Pesticide Management for Water Quality, Principles and Practices
abstract: This publication intends to explain the fates of pesticides after they have been introduced into the environment. In addition, processes which affect pesticide movement and management practices which reduce their losses are discussed. We hope that this information will foster the use of sound management practices which protect the quality of New York State's water resources.

title: Ethnicity Based Wage Differentials in Ecuador's Labor Market
abstract: This study first offers a brief literature survey of labor market discrimination due to ethnicity against the indigenous and Afro-descendant population in Ecuador, a largely mestizo country. We use ethnic self-identification reported in the 2000 EMEDINHO survey as a proxy for ethnicity. Next, we introduce an extended wage differential decomposition model for wage earners based on the traditional Oaxaca-Blinder methodology and a system of simultaneous equations. Using the 2000 ENEMDUR employment survey we then estimate wage, education, sector and geographic outcome differentials due to endowments and due to discrimination between two designated ethnic clusters (i) indigenous people and Afro-descendants and (ii) mestizos and whites. This methodology allows us to identify and measure the direct and indirect channels through which discrimination impacts wages. We obtain higher estimates for discrimination based on a comparative analysis of our results versus two other studies available for the country. We find evidence also about the role that the intergenerational transmission of human capital from parents to children has on education and labor market outcomes.

title: Information Occupations and the Socioeconomic Environments in U.S. Metropolitan Areas
abstract: Matthew P. Drennan, Susan Christopherson, and Mildred Warner are my dissertation committee members.Throughout this dissertation, I focus on information occupations, which deliver knowledge and information-intensive input to economic activities, and which are high-end jobs requiring a high level of education and skills. The main questions are fourfold: What are information occupations?; How can we define information occupations and their geographic profiles?; Why are information occupations important in metropolitan economies?; What metropolitan characteristics affect the specialization in information occupations?

Regarding these questions, I suggest a new analytical framework to define ?information occupations? and explore their geographic profiles using two databases: Occupational Network Information (O*NET) and Occupational Employment Statistics (OES). Information Occupations are becoming important in regional studies in two aspects: the growing employment in information occupations in the new economies, compared to non-information occupations, and their importance to metropolitan economies. Information occupations prefer cultural environments with innovation capacity and high density of the younger workforce, rather than diversity. In terms of economic functions, metropolitan size is more closely related to urban hierarchies than to Internet infrastructure. Policy makers are able to enhance the competitiveness of medium sized metropolitan areas if they target regular information occupations for regional development. Industry specialization is still important to location choice of information occupations.

title: Constrained Choice and Contingency: Military and Economic Competition as the Mechanism for Technological Determinism
abstract: The study of technology is divided. There are scholars, found especially in sociology and history, who emphasize interpretive flexibility, agency and historical contingency. These I label 'mild-constructivists.' Other scholars, found especially in business, economics, military studies and macro-history, emphasize functional adaptation and 'deterministic' trends. These I label 'sociotechnical adaptationists.' A theory of sociotechnical evolution can unify the insights of these seemingly contradictory approaches to technology.

Competitive processes constrain sociotechnical variation: the range of interpretations and choices available to an actor are constrained by the imperative to survive. Economic and military competition, in particular and in the long run, constrain an actor's decisions to those that promote, respectively, the profit or power of the encompassing 'social organism,' such as a firm or state.

Thomas Misa has noted that scholarship with large-scales of analysis tends to be technologically deterministic. At large scales of analysis, instances of economic and military competition are more common. I argue that economic and military competition is the mechanism that gives rise to emergent deterministic patterns. New technology "merely opens a door; it does not compel [us] to enter." It is economic and military competition that shoves us through.

Military competition tends to operate over longer time scales and constrain economic and social competitive

processes. Economic competition operates over middle time scales and constrains social competitive processes. These competitive forces 'select' for economically and militarily functional sociotechnical configurations. Thus, at larger scales of analysis the competitive processes giving rise to functionalist adaptation are more apparent.

A unified theory of sociotechnical evolution can reconcile the detailed micro-narratives of mild constructivism with the functionalist insights of the adaptationists. Almost all theories of technology are appropriate in their proper analytical context, defined by the character of variation (in particular, the degree of path dependency) and the kinds of competitive processes present.

There are, however, two approaches to technology which cannot be reconciled within a theory of sociotechnical evolution. They are radical social constructivism and na?ve technological determinism. Scholars in the first group claim that there is unlimited interpretive flexibility, agency and contingency. Scholars from the latter group naively attribute agency to technology, failing to acknowledge the absence of a micro-theory for their claims.

The history of Japan's use of firearms provides an illustration of the utility of the sociotechnical evolution framework. The introduction of firearms into Japan, beginning in 1543, follows the adaptationist script: two firearms arrived with some Portuguese adventurers, were bought, reverse engineered, and soon produced and used in the hundreds and then thousands.

From the 1600s to 1853, though, Japan's use and development of firearms stagnated. Constructivist scholars could productively explore the social reasons for this 'reversion to the sword.' Their findings are bounded, though, by the conditions that characterized this period, namely: the absence of internal and external military competition.

In 1853 Commodore Perry's ultimatum ended this 250 year 'retrogression' by imposing a painful imperialist challenge. Japan could no longer maintain its isolation without risking following the fate of China in the Opium Wars. Japan's ensuing industrialization and modernization poses a problem for both constructivist and adaptationist theories of technology. Japan eventually adopted superior Western military technologies, but not in the simple functionalist way that an adaptationist would expect. A satisfying history requires an appreciation for both the cultural and military context, and the ways that they interact.

title: RATES, IMPORTANCE, AND CONTROLS OF NITROGEN FIXATION IN OLIGOTROPHIC ARCTIC LAKES, TOOLIK, ALASKA
abstract: Biological nitrogen (N) fixation of atmospheric N2 by free-living cyanobacteria in aquatic environments is common, and in many ecosystems, it can account for a significant portion of the biologically available N inputs. Although N fixation can compensate for N limitation, N limitation is maintained over relatively long time scales in many oligotrophic lake ecosystems. This dissertation examines the importance of benthic and pelagic N fixation in the N economies of oligotrophic lakes in arctic Alaska (Chapter 1) and examines nutrient, light, and grazer controls on benthic N fixation (Chapters 2 and 3). Both benthic and pelagic N fixation are prevalent in many lakes across the Alaskan arctic landscape, ranging from 0.12 ? 1.5 mg N m-2 day-1 and 0 ? 2.56 mg N m-2 day-1 respectively. Pelagic N fixation is much higher than has been reported elsewhere for oligotrophic lakes, and is more important than previously thought, comprising ~ 75% of N inputs to one lake. Benthic N fixation is lower than has been reported for other oligotrophic systems, and is roughly equivalent to N inputs from atmospheric deposition on an areal basis (~25 mg N m-2 year-1). On the landscape scale, N fixation in lakes roughly equal that in terrestrial ecosystems in this Arctic region. Benthic N fixation generally appears to have a saturating response to light availability within individual lakes, but light does not explain variation in benthic N fixation across lakes or years. Whole-lake fertilization

and laboratory experiments indicate that P input stimulates benthic N fixation while N input suppresses N fixation when N is added either alone or in conjunction with P in Redfield proportion. Snails at ambient density cause a small decline in benthic N fixation (0.85 ? 1.8% reduction over the summer). These patterns are corroborated in the landscape: lakes on younger surfaces have higher P, more snails, and higher rates of N-fixation than lakes on older surfaces.

title: As for the Future: Contingent Subjects and Feminist Practice of Writing Women into History
abstract: This dissertation explores the practice of writing women into history in the post-1945 period. My immediate area of study is with the large number of writers who adopted narratives as a subject-constitutive method in placing women in history. Marked as an "urgent" task, writing new history occupied a privileged position in a teleological narrative of emergent democratic development. Women were particularly important at the outset because of the relatively few works of history produced. In practice, writing the subject "women" into teleological narrative often meant, writing women?s history as Bildungsroman. In particular, I consider the ways in which prostitution, modernity, discourses of nationalism, and the (emerging) political subjectivity of women grounded the practice. I take, as a point of departure, the figure of native women, imagined to have hailed from the countryside and marked as embodying an un-modernized subjectivity. These women migrated to the urban centers and occupied an important place in the emergent discourse of Japanese feminism as sexually marginal and aberrant subjects (not true feminist subject) and as sexual victims of imperialism (proper subject of feminism.) Marked by the national and occupation discourses, the power of "women as subject" relied, precisely in part, on "women as simulacrum of democratic being." This framing, rather than opening up possibilities for assemblages and previously unknown alignments, occlude the history of uneven development. My reading of this material invites a direction towards a history practice of non-containment. The large volume of texts provide a rich field in which to question what it would mean to avoid making sense of the past and to tease out a practice of fragmented and incomplete history towards an indeterminate future.

title: UNEMPLOYMENT, IDENTITY, AND SELF-CONFIDENCE: THEORETICAL MODELS AND EXPERIMENTAL EVIDENCE
abstract: In the leading chapter of this dissertation, "Unemployment, Vulnerability and Poverty: A New Class

of Measures, Its Axiomatic Properties and Applications," we, Kaushik Basu and myself, derive a new class of measures for unemployment or poverty. Measures of unemployment and poverty have usually focused solely on those currently unemployed or below the poverty line, ignoring those who are vulnerable to becoming unemployed or falling into poverty. We fully characterize a class of measures that, unlike the standard measures of unemployment or poverty, account for the amount of vulnerability that exists in a society and apply those measures to the USA and South Africa.

In the second chapter of this dissertation, "Unemployment and Family-Values," I propose a new class of unemployment measures that incorporates the externalities one receives from living in a household with employed individuals. The standard measure of unemployment does not do this. A household with at least one employed person is more likely to have heating, water, and other household public goods than a household where everyone is unemployed. Given this, I axiomatize a class of unemployment measures that is sensitive to household unemployment levels. This is done by assuming that if unemployment is held constant, say at fifty percent, an economy where half of each household is employed is better than an economy where half of the households are fully unemployed and half are fully employed.

The third chapter of this dissertation, "Racial Identity, Performance and Self-Confidence: A South African Experiment," deals with the effects of racial identity in Post-Apartheid South Africa. Racial gaps across many measures of performance are well documented. Whether these gaps occur because of discrimination or are due to ex-ante differences between racial groups is still unanswered. Using experimental data from Cape Town, we, Erica Field and myself, examine how different environments and incentive schemes effect a student's performance and her level of self-confidence. We find that cuing a student to her racial identity has a significant affect on performance, self-confidence and where a student places herself within a distribution. These differences are statistically significant even if the groups are ex-ante similar.

title: Plant and insect-mediated invasiveness of Phragmites australis and the litter dynamics and biodiversity of six freshwater macrophytes
abstract: My thesis involves two distinct projects related to wetland plants. The first evaluates plant traits for their contribution to the success of invasive Phragmites australis in North America and their interaction with herbivores. The second investigates the relative effects of six plant species, with different growth forms, status (native v. nonnative) and tissue quality, on litter dynamics and invertebrate diversity in a New York freshwater wetland.

Prevention is the most cost-effective and successful means of managing invasive plants. Predicting future invasions depends on identifying plant traits that facilitate invasive success. We investigated the influence of above-ground growth phenology and increased stem height on the success of invasive Phragmites australis in North America, using a phylogenetically-controlled comparison with a native, non-weedy P. australis subspecies. We also measured the effects of specialist stem-galling Lipara flies and a generalist aphid (Hyalopterus pruni), both nonnatives to North America, on these above-ground traits. Comparisons were made in 1) a common garden at Cornell University, Ithaca, NY, in 2003 and 2004, and 2) a field site at Montezuma National Wildlife Refuge, Seneca Falls, NY in 2003. In the garden, but not the field, nonnative P. australis leaves remained green for about a month longer (native v. nonnative: 2003 = 59.93 v. 85.5 days, P = 0.0002; 2004 = 52.29 v. 87.39 days, P = 0.02). For nonnative P. australis, leaves of the upper canopy consistently lived longer while leaf lifespan in the lower canopy was shorter or the same. Greater investment in high canopy leaves may increase carbon gain efficiency of nonnative P. australis. Nonnative P. australis grew taller in the field but this was mediated by disproportionate Lipara attack rather than plant status (native or nonnative). Lipara attack reduced stem height of all stems but only increased the lifespan of nonnative P.

australis? low canopy leaves. Aphids had no significant effect on measured plant traits. Through increased carbon gain, leaf phenology may contribute to P. australis? competitive superiority over its native conspecific. Higher susceptibility of native P. australis to nonnative herbivores may also facilitate nonnative P. australis? competitive superiority.

Senesced plant litter from emergent macrophytes fuels freshwater wetland productivity and nutrient cycling. Litter nitrogen content generally has a direct, positive effect on quantity and rate of resource availability to wetland biota. Since plants vary in their nitrogen content, shifts in plant community composition may alter important wetland functions. To study the consequences of changing plant dominance, we compared litter mass loss and invertebrate richness and abundance of six common macrophytes in a central New York freshwater wetland. Plants studied include Typha latifolia L. (broad leafed cattail, Typhacea), T. angustifolia L. (narrow leafed cattail), Phragmites australis (cav.) Trin ex. Steudel (common reed, Poaceae), P. australis subspecies americanus Saltonstall, P.M. Peterson & Soreng, Lythrum salicaria L. (purple loosestrife, Lythraceae), and Phalaris arundinacea L. (reed canarygrass, Poaceae). After nine months, mass loss of most plant species diverged significantly. Plant effect on invertebrate colonization was season and species-specific, with P. arundinacea almost consistently supporting higher invertebrate densities. Although %N differed among some plant species, it was not a good predictor of mass loss or invertebrate abundance and richness. Including plastic drinking straws as a treatment revealed that several invertebrates used litter for substrate rather than food. We conclude that shifts in plant dominance among the six wetland macrophytes investigated could potentially alter wetland function, by changing decomposition rates and the invertebrate community. Net quality of litter resources, which depends on the combined influence of morphology, chemical quality of specific plant organs, and feeding ecology of specific taxa, may be a better predictor of species effects on decomposition and diversity.

title: The Contemplative Idiom in Chan Buddhist Rhetoric and Indian and Chinese Alchemy
abstract: Daniel Boucher, Daniel GoldThe first chapter is an analysis of the rhetorical and transformative functions of language in Chan Buddhist rhetoric. It begins with a critique of the traditional category of "mysticism" as used to describe religious traditions defined by a focus upon "mystical experience" as an extraordinary psychological state that is phenomenologically similar across traditions. It proposes a different typology for identifying these types of traditions that refers to their similar rhetorical idiom of contemplation and transformation of consciousness. The case of Chan Buddhism is examined to illustrate how this contemplative idiom functions rhetorically to create and contest authority, and how it works to frame an alternate conception of reality and lead the practitioner to instantiate that conception by transforming his apprehension of reality.

The second chapter is an exposition and examination of the religious phenomenon of alchemy, specifically as manifested in the traditions of India and China. It argues that alchemy is not a single, continuous global phenomenon, but rather a peculiar set of instances of contemplative language applied to certain commonly observed material processes. It concludes that each case of alchemy is an independent use of a peculiar idiom to express specific cultural values, but that the parallel material processes involved necessarily produce certain similarities in each instance.

title: The Political Economy of Transition in Laos: from Peripheral Socialism to the Margins of Global Capital
abstract: Remarkably, in the view of some observers, a poor and relatively weak government in Laos survives as a one-party state, even as it transforms the country?s political economy in response to declining communist fortunes in the early 1990s and the onslaught of economic globalization. How has the Lao government managed the socialist transformation and capitalist incorporation, while maintaining some semblance of external sovereignty and internal legitimacy? Through the broad lens of political economy and sociology, my research addresses this question, in exploring three areas of Lao state capacity: (1) political structure, (2) public administration, and (3) fiscal management.

I rely on several sources: a set of observations during my time on research assignment in Laos (May 2004-April 2005); an examination of governance-related, donor-funded development projects; an exhaustive survey of government laws, regulations, and documents since the reform period; and a review of literature on the political economy of development, market transition, and globalization. To assess different points of view on contemporary Laos, I conducted open-ended interviews with selected Lao officials, townspeople, expatriates, international consultants, and members of the diplomatic and donor communities.

From my research, evidence suggests that the Lao government actively promotes political, administrative, and economic centralization over regionally dispersed and fiscally independent provinces. In the transition process, a strong central government capable of regulating and enforcing economic governance has gradually eroded traditional autonomy of Lao provincial authority. The recent history reveals a party apparatus pragmatically adjusting to economic constraints, while consolidating its power base, unifying the country, and exerting its centralizing influence on an ideologically indifferent countryside.

Laos is not an isolated case. For many developing countries struggling to build a unitary state and a national economic space of private exchange, centralized control over regionally autonomous regions constitutes one of the major governance challenges of nationally guided development. Contrary to the general global trend of public decentralization in the transition process, Laos provides a stark contrast, offering a valuable insight into the important role of governments in structuring economic relations.

title: Kicking Black Holes, Crushing Neutron Stars, and the Validity of the Adiabatic Approximation for Extreme-Mass-Ratio Inspirals
abstract: Current experiments hope to detect gravitational waves--oscillations of space and time predicted by Einstein. The strongest sources of gravitational waves are compact object binaries--orbiting neutron stars or black holes. Gravitational waves carry away energy, linear momentum, and angular momentum until the binary merges to form a single black hole. This thesis concerns three distinct projects regarding binary coalescence.

The linear momentum radiated when binaries merge imparts a recoil or “kick” to the final black hole. Black hole recoils have important astrophysical consequences: black holes can be displaced or ejected from their host galaxies or globular clusters, affecting black hole growth, quasar activity, and the density structure of galaxies. We compute the kick velocity using black hole perturbation theory, treating the binary as a small mass spiraling into a massive, spinning black hole. We find that the recoil can easily reach ~100-200 km/s but probably does not exceed 500 km/s.

Binary neutron stars are another important source of gravitational waves. Understanding the final coalescence phase of the gravitational wave signal requires computer simulations. Some numerical simulations have shown that the neutron stars are subject to a crushing force late in the inspiral. This crushing effect has had no explanation and is disputed. We show that a compressive force arises due to a coupling of gravitomagnetic

tidal fields to the current-quadrupole moment of the neutron star. However, except in special circumstances, this gravitomagnetic crushing effect is overwhelmed by stabilizing Newtonian tidal interactions.
A small compact object orbiting a massive black hole will be a strong source for space-based gravitational wave detectors. Accurate waveforms for these systems will require computing the self-force on the compact object. The tools to do this do not yet exist. But when the inspiral time is much longer than the orbital period (the adiabatic approximation), approximate waveforms for generic orbits can be computed. We estimate the error in the adiabatic approximation by computing the gravitational wave phase using post-Newtonian theory. We find that, for orbits with small eccentricity, the adiabatic waveforms will be good enough for detection but not for parameter extraction.

title: Development of molecular subtyping databases to improve control of Listeria monocytogenes
abstract: Listeria monocytogenes is a foodborne pathogen that can cause a serious foodborne disease, listeriosis, which may result in abortion, meningitis, and septicemia. The high hospitalization and mortality rates of listeriosis warrant continued research efforts to reduce the transmission of L. monocytogenes to humans. Molecular subtyping techniques, which can be used to differentiate bacteria beyond the species level, facilitate the identification and tracking of L. monocytogenes subtypes throughout the food chain. Pulsed-field gel electrophoresis is a rapid and highly discriminatory molecular subtyping method currently used by public health and regulatory agencies to identify and track outbreaks of foodborne disease and link outbreak related cases to suspected vehicles. Although PFGE facilitated outbreak recognition and response has been successful in reducing the number of listeriosis associated fatalities, additional large-scale analysis of subtype data is needed to develop a better understanding of L. monocytogenes ecology and further reduce the incidence of foodborne listeriosis. To this end, we subtyped 495 L. monocytogenes isolates from human clinical cases, foods, ruminant farms, and urban and natural environments using two-enzyme (AscI and ApaI) PFGE to better understand L. monocytogenes PFGE type diversity and distribution. We found that while L. monocytogenes is a genetically diverse organism, nine PFGE types were significantly associated with certain sources, and two PFGE types were specific to a single processing facility each. Conversely, nine PFGE types were geographically widespread and isolated from multiple sources, indicating that large molecular subtyping databases are necessary to facilitate epidemiological investigations by identifying the distribution patterns of PFGE types that cause outbreaks.
To meet this need, we developed PathogenTracker, a publicly available molecular subtyping database that will facilitate storage and large-scale analysis of different L. monocytogenes subtype data. Data in PathogenTracker can be queried through a variety of options, including DNA sequence and banding pattern-based searches (e.g., ribotype, PFGE type). This database also allows for the creation of individualized summary tables and permits simple statistical analysis of summary table data. Currently populated with subtype data for over 6,000 L. monocytogenes isolates, PathogenTracker will facilitate more rapid listeriosis outbreak detection and source tracking, development of a better understanding of L. monocytogenes transmission and ecology, and definition of specific characteristics for L. monocytogenes subtypes isolated from different sources populations.
We also developed a freely available standard L. monocytogenes reference strain collection, organized into a diversity set (25 isolates representing 25 PFGE types) and an outbreak set (21 isolates representing nine listeriosis outbreaks), which has not been previously available. In combination with inclusion of these isolates in PathogenTracker, which includes continuously updated information on strain characteristics and peer-reviewed references that utilized specific isolates, this strain collection provides a unique resource that will aid efforts to further improve our ability to reduce human foodborne listeriosis through development

of improved diagnostic procedures and intervention strategies. In addition, this strain collection provides a unique resource for basic and applied studies on the physiology, ecology, evolution, and pathogenesis of L. monocytogenes.

title: THREE ESSAYS ON THE EMPLOYMENT AND ECONOMIC WELL-BEING OF VULNERABLE POPULATIONS
abstract: Using data from the Canadian Survey of Labour and Income Dynamics (1993 through 2001), the first essay examines how wage differences between working age people with and without disabilities changed over time. Using Oaxaca-Blinder and Juhn, Murphy, and Pierce techniques to measure the share of the wage gap that remains unexplained after controlling for differences in observed wage-determining characteristics, the essay finds a substantial and growing wage gap between persons with and without disabilities that varies significantly throughout the distribution. Low skilled/low wage disabled workers are less seriously impacted by wage discrimination than their higher skilled/higher wage counterparts.
Using retrospective data from the 1990 Panel of the Survey of Income and Program Participation, the second essay exploits state-level variation in legislation prohibiting disability discrimination prior to the passage of the Americans with Disabilities Act of the 1990 to test the effect of such laws on the timing of Social Security Disability Insurance (DI) application following the onset of a health condition. Using hazard models, the essay finds that workers who lived in states that had traditional disability discrimination prohibitions or such prohibitions plus a reasonable accommodation requirement were significantly slower in applying for DI benefits than were workers in states with no such prohibitions. Increasing the likelihood of acceptance onto the program increases the speed of application.
Using data from the United States Current Population Survey, the British Household Panel Study, the German Socio-Economic Panel and the Japanese Survey of Income Redistribution, the third essay uses kernel density estimation to show how the income distribution changed between the peak years of the 1990s business cycle in these four major OECD countries. The entire after-tax household size-adjusted income distribution moved to the right in the United States and Great Britain. Germany and Japan experienced a decline in the middle mass of their income distributions that spread mostly to the right. In the United States and Japan, younger persons fared better than older persons, while the opposite was the case in Great Britain and Germany. Income inequality fell in all four countries among the older population.Tom Symons Dissertation Research Fellowship (Statistics Canada, Ottawa, Canada) National Institute on Disability and Rehabilitation Research (NIDRR) grant #H133B9800038 grant from the U.S. Social Security Administration (SSA) to the Michigan Retirement Research Center (MRRC) through the MRRC?s Steven H. title: An Examination of Green Roof Plant Selection and Design to Optimize for Evapotranspiration
abstract: Thomas H. Whitlow, Louis Albright, Nina BassukGreen roofs are a new and growing field in North America. Along with the need for innovation in design, research on green roof systems and performance is necessary to capture and improve the way in which green roofs function. Green roof performance and benefits have traditionally been measured by their ability to capture storm water, cool the building below it by means of shading and evaporative cooling, and their ability to successfully support plant life. Currently,

green roofs design is dominated by shallow, light weight substrates and extremely drought tolerant plants, often from the Crassulaceae. This design predilection is based upon the limiting factors of building loading limits and installation costs. However, this design negates most of the benefits green roofs are expected to provide. Water holding capacity, and thus the green roof?s ability to retain significant volumes of storm water, is contingent on the depth of the substrate. By selecting plant species which are highly drought tolerant, the evapotranspiration rates are reduced. Additionally, many members of the Crassulaceae have an inverted stomatal rhythm wherein stomates are open at night to permit gas exchange with the atmosphere when transpirational demand is low and when cooling of the building is less needed. Therefore, a shift in focus is necessary, in which the design of green roofs is based on optimizing the performance of desired benefits. While limitations in cost and loading must be accounted for, they should not be the driving force of green roof design.

In response to this issue, this thesis examines an alternative approach to conceptualizing and designing green roofs. The following research presents a green roof system that held all storm water to the point of full saturation. Additionally, plant species capable of withstanding both drought and flooding were placed in a green roof setting. Evapotranspiration rates were recorded for Solidago canadensis and Spartina alterniflora during the summer of 2005, applying measured volumes of water to test the system?s ability to hold large volumes of water as well as the rate at which this water could be used by the plants. Full capacity of the substrate averaged approximately a 2-year return frequency storm for New York City, at 3 inches of water over a 24 hour period. Both plant species were capable of consuming enough water to shift from saturation to no levels of standing water within 4 days, suggesting the system?s ability to withstand several rain events in succession. The rates of evapotranspiration slowed as less water was present in the substrate, suggesting that the plant species could survive a prolonged period of drought by adjusting water usage. By storing greater volumes of water within the substrate, larger volumes of water were made available to the plant, reducing the need for more frequent rainfalls. Ultimately, this system exhibits a tolerance of drought and flooding and provides greater opportunity for plant survival, as compared to a freely draining, more drought-prone green roof design approach. While the studies conducted were for small units embedded within a larger green roof, and data was collected for a short period, the results suggest that this approach has immense potential in improving green roof benefits, and warrants further study.Edna Bailey Sussman Award

title: Efficiency of New York Dairy Farms: Exploring the Role of Managerial Ability
abstract: This paper explores the role of management ability in explaining efficiency on New York dairy farms using both Data Envelopment Analysis (DEA) and stochastic frontier estimation. First, we test whether computed technical, cost, and revenue efficiencies under DEA are due to a missing input, which we argue may be the management input. Using an unbalanced panel of individual farm data from the Cornell University?s Dairy Farm Business Summary (DFBS) from 1993 - 2004 we define 6 inputs, including operator labor, hired labor, purchased feed, livestock, capital, and crop inputs, and two outputs, including milk output and all other outputs. We define the management input in two ways. First, the DFBS asks farmers to estimate their own values of labor and management. Second, the panel nature of the data set allows us to use the previous year?s net farm income as a measure of farmer management ability. Using the lagged data prevents any contemporaneous bias in efficiency measurement and is consistent with Stigler's conjecture that differences in management ability should be captured in profits.

To test for the effects of the missing management input we first calculate DEA efficiency scores using the original six inputs and two outputs. These efficiencies are recalculated first using operators? values of labor and management, and then using lagged net farm income, in place of the operator labor input. The resulting

efficiency scores are compared. We find weak evidence of the missing management input using our two measures, and that change in computed efficiencies resulting from including the management input depends on whether one uses an input or output orientation. The change in efficiencies using operators? values of labor and management are small, often less than 1 percent. Using lagged net farm income as the management input increases computed input-oriented technical efficiency by an average of 1 percent and cost efficiency by 1.2 percent. Output oriented technical efficiency increases by 1.7 percent and revenue efficiency increases by nearly 2 percent. The impact of this measure of the management input on the allocative components of cost and revenue efficiencies was negligible, indicating that this measure of management ability serves more to explain differences in technology choice than allocative abilities.

We also estimate input- and output-oriented technical efficiencies, cost efficiencies and revenue efficiencies using stochastic frontier functions. The technical efficiencies are estimated using distance function methodologies. We transform our management input variables to a per cow basis and include them as efficiency effects variables along with operator age, education, farm size, and years of participation in the DFBS. This allows us to measure the impacts of management ability on farm efficiency while controlling for other factors that may also affect efficiency. We estimate conditional mean and heteroscedastic efficiency term specifications for each frontier model. We again find that using lagged net farm income per cow may be a preferred measure of management ability than farmers? own estimates of the value of their labor and management per cow. We find that, at the margin, this measure of management ability increases input-oriented technical efficiency by 1.4 ? 1.5 percent and cost efficiency by between 1.7 ? 2.9 percent, depending on specification. Output oriented technical efficiency and revenue efficiency increase at the margin by 1.8 ? 3.0 percent and by 2.4 ? 4.2 percent respectively. We also find increasing efficiency with operator education, farm size, and extended DFBS participation and decreasing efficiency with operator age.

Finally, we present a discussion of whether an input or output orientation is more appropriate for the farms in our sample and compare the dairy farm efficiencies predicted by DEA and the stochastic frontiers. We find that, for our data set, the distributions of farm efficiencies are very similar under DEA and stochastic frontier estimations, but individual farm rankings are quite different between the two.

title: Life in an altered landscape: Reproductive success and foraging efficiency of Florida Scrub-Jays (Aphelocoma coerulescens) in regenerating pasture
abstract: The challenge of protecting habitat for imperiled species amidst continuing, excessive habitat alteration constrains our conventional definition of ?suitable? habitat. Certain endangered species are known to persist on modified habitat, especially where their native habitat is largely destroyed. I examined reproductive success and foraging efficiency of Florida Scrub-Jays (Aphelocoma coerulescens) in a human modified habitat ? regenerating pasture ? along a pasture-native scrub interface. From 1985 to 2003, Florida Scrub-Jays were equally successful at producing young in regenerating pasture and native scrub. Production of eggs, nestlings, fledglings, independent young, and yearlings per nest were not statistically different between pasture and scrub, but consistently trended higher in the former. Nest success in pasture was significantly higher among pairs lacking nonbreeding helpers compared to pairs with helpers. Breeding males preferred pasture for their overall daily activities, and foraged equally frequently in pasture and scrub. Foraging efficiency of breeding males was significantly higher for small prey items, but significantly lower for medium and large prey items when they foraged in pasture compared to when they foraged in scrub. Availability of small prey items was significantly higher in pasture than in scrub; the availability of medium and large prey items were not significantly different between habitat types. These results suggest that regenerating pasture can provide suitable habitat for Florida Scrub-Jays when in close proximity to native scrub. The definition

of suitable habitat for this habitat-limited species should be expanded to include areas of pasture containing regenerating oak shrubs.

title: Field Measurements of Bulk Flow and Transport through a Small Coastal Embayment Having Variable Distributions of Aquatic Vegetation
abstract: This thesis is largely the documentation of two passive tracer release studies performed in Sterling Pond (SP), a small embayment on the southern coast of Lake Ontario (LO). SP has a large watershed and is strongly connected to LO by a long and narrow channel. The experiments were designed to decipher the effects of aquatic vegetation (macrophytes) on flow and transport through SP and through shallow embayments dominated by macrophytes in general. Towards this objective, the studies captured the residence time distribution (RTD) of water entering SP from its watershed under two different spatial distributions of macrophytes, and they were conducted in synchrony with extensive surveys of macrophyte density, height, and species composition. Variables relevant to the dynamics of SP were continuously monitored at its boundaries, including meteorological conditions, water surface elevation, flow, and temperature (temperature was continuously monitored within SP as well); bathymetric data was collected once. The first study took place when watershed flow was high and macrophytes were sparse -- mean residence time was measured to be 0.6days. The second took place under moderate barotropic forcing from LO when watershed flow was low and macrophytes were dense and uniform across SP -- mean residence time was measured to be 20days. As the studies were conducted under fairly extreme environmental conditions, the measured RTD's roughly capture the range of residence time scales of water entering SP from its watershed. The tracer experiments, macrophyte surveys, and auxiliary data comprise a benchmark data set that may be used for development and validation of numerical models of flow through flexible vegetation.

title: INFLUENCE OF SIDEROPHORE PRODUCING BACTERIA AND ORGANIC LIGANDS ON PHASE DISTRIBUTION OF CADMIUM AND ITS UPTAKE BY BRASSICA NAPUS IN THE PRESENCE OF GOETHITE
abstract: MS ThesisCadmium is a non essential trace element, which is toxic at very low concentrations. While Cd can occur at high concentrations as a result of the weathering of Cd-rich minerals, most high

concentrations are of human origin. Brassica have been shown to be hyper-accumulators of cadmium and are therefore good candidates for the application of phytoremediation to remediate soils with Cd contamination. The processes leading to successful phytoremediation are not fully understood, and may be dependant upon the bacterial community present in the rhizosphere. Bacteria in the vicinity of plant roots may degrade plant root exudates that would otherwise act to bind metals and bacteria can produce metal binding ligands such as siderophores. This study was conducted to determine if the presence of siderophore producing bacteria will affect cadmium uptake by Brassica napus (canola) in a model system. An apparatus was designed that included the dominant components of a phytoextraction system, a solid phase (modeled using ?-FeOOH, goethite), a liquid matrix (chemically defined MMS-2 medium in which metal speciation may be calculated), a plant (B. napus) and a siderophore producing bacterium (Burkholderia cepacia). Physical separation of the plant from the Fe was needed to discern plant uptake of Cd and was accomplished by utilization of dialysis membranes. Components of the system were studied independently before combining for short term plant uptake experiments. The system was kept at a pH of 6.4 to model a typical soil pH. Studies of Cd adsorption on ?-FeOOH in MMS-2 revealed that adsorption was fast, and that desorption was biphasic and incomplete within the time frame of the experiment. A linear equilibrium adsorption isotherm for Cd on ?-FeOOH was developed with a sorption constant, Kd, of 2600 mL/g. A linear sorption relationship was also developed for Cd sorption by the walls of the glass reactor vessel, with a volumetric sorption constant, Kg (unitless), which is proportional to the surface area to volume ratio at a given volume.

Bacterial growth was measured at two initial substrate concentrations, 68 and 272 mg/L dextrose added to the MMS-2 media. Stationary phase was achieved in approximately 40 hours after inoculation. Siderophore production by B. cepacia was measured by the Chrome Azurol Sulfonate (CAS) technique, and yielded a maximum concentration of 39 ?M for the experiments.

Cd speciation, phase distribution, and uptake by B. napus were perturbed in the experimental system by the addition of salicylate, citrate, ethylenediamine tetraacetic acid (EDTA), a suspension of B. cepacia and its associated siderophore, or the supernatant containing the B. cepacia siderophore. Changes in phase distribution of Cd upon addition of ligands with defined Cd binding constants were not consistent with the values predicted by MINEQL+, where CdEDTA>CdCitrate>CdSailcylate. Salicylate desorbed more Cd than citrate, and was chosen along with EDTA for plant uptake experiments. Cell suspensions and siderophore containing supernatant were shown to enhance the adsorption of Cd under the experimental conditions.

Addition of plant roots to a ?-FeOOH suspension resulted in a rapid capture of goethite onto the roots, as a result it was impossible to distinguish Cd in the plant root from Cd sorbed to the FeOOH. A dialysis membrane was utilized to separate roots from the Fe solid phase. The presence of the dialysis membrane did not create a detectable change in adsorption of Cd.

Plant uptake experiments were conducted over a short time scale. An eight hour equilibration step was utilized after perturbations of Cd-?FeOOH adsorption equilibrium (by addition of ligand) and followed by six hours of plant uptake. Both salicylate and EDTA were effective in increasing the phytotextraction of Cd. Salicylate may have more potential of these two ligands for field application because of the concerns associated with toxicity of and the mobilization of the Cd-EDTA complex. B. cepacia and its supernatant with dissolved siderophores did not improve uptake of Cd by canola, but did desorb more Cd.CEE School

title: Catalyst of Constraint? On the Complex Role of Social Capital in Transitioning Rural Economies
abstract: This dissertation concerns itself with poverty amongst the rural poor, and specifically with contributing to the set of tools and policies that can effectively improve their economic wellbeing. Rural communities in developing countries play host to the majority of the world?s poor. Widespread and

persistent poverty has led to a growing appreciation of the unique set of obstacles limiting economic growth and progress in rural communities. It is now widely accepted that economic behavior, especially in more traditional communities, is imbedded within a socio-cultural system that circumscribes the space of economic possibilities and outcomes. The dominant view has it that the highly personalized nature of social interaction common to rural communities can be harnessed as productive "social capital" to support economic interaction in the absence of formal market institutions.

The three papers of this dissertation aim to contribute to the existing literature on the social economics of development that goes beyond the myopic view of social capital as a productive input to economic endeavor. They each emphasize the importance of a nuanced, context-specific understanding of how the set of shared norms, behaviors and expectations characteristic of rural environments interact and co-evolve with an emerging market economy. In three different settings I demonstrate how the na?ve and generalized application of social capital as a productive resource limits welfare growth, supports ineffective institutions and promotes faulty policy instruments.

The first paper shows how spatially-varied returns to human capital that fuel migration may diminish the capacity of social capital to support informal contract enforcement. The second paper demonstrates how microfinance institutions whose design relies on an inadequate characterization of social capital may actually erode the very social forces it hopes to exploit. Finally, the third paper highlights how increasing material incentives coupled with a dysfunctional mix of informal institutions and formal regulations can breed rent-seeking that adversely affects the welfare and productivity of the majority of members in a producer organization.

The contribution of this dissertation is to cast a spotlight on how specific features of the socioeconomic landscape interact to jointly determine the space of economic outcomes and the trajectory of social change. In doing so, it informs the design of appropriate policies and institutions that provides the rural poor with a level-playing field and promotes the set of incentives crucial for effective economic transacting.

title: INVERSE IDENTIFICATION OF TRANSIENT THERMAL PROPERTIES AND HEAT SOURCES USING GENETIC ALGORITHMS
abstract: This work investigates the solution to inverse problems in heat transfer using genetic algorithms. Genetic algorithms are robust, stochastic search techniques which also admit the ability to search highly nonlinear problems. In this work, computational techniques are developed for the simultaneous inverse identification the internal heat generation and the thermal diffusivity of early age concrete as functions of time, as well as constant convective coefficients. Through the use of several numerical examples it is shown that this methodology yields accurate results for the inverse heat transfer problem in finding several unknown conditions simultaneously.

title: Gender Construction and Korean Mordernity
abstract: Novels Mujong, Hwanhui, and Kim Yonsil ch'on can be read as a commentary on Korean modernity in their portrayal of women during a specific time in Korean history that is characterized by an abrupt transition from feudal society to modern society. When the enlightenment thinkers in the 1890s first promoted civilization, nationalism and social reform, they targeted the traditions and perspectives defining women's role in society. Kenneth Wells says in his discussion "Women and the Kunuhoe Movement," "Korean society historically presents an almost prima facie case for using gender as an interpretive framework. The metaphysics, mores, human functions, architectural designs, spatial divisions, and state ideology of the Choson dynasty were so consciously organized with reference to gender principles that instead of a social construction of gender one might justifiably speak of gendered construction of Korean society." I examine this "gendered construction" in modernity and explore its function, its limits, its manifestations and its purported mission.

1894 marked a violent and chaotic turning point in Korean history, which made it clear that the structures of Choson dynasty were no longer able to sustain the internal and external pressures suffocating Korea. 1894 also revealed Korea's failure to process modernity according to its own agendas. In this context civilization, nationalism and social reconstruction did not mean addressing "real" and urgent Korean problems arising from the breakdown of feudal order, economic disparity, social injustices and political chaos, instead it meant privileging and forcing a modern structure that seemed powerful, dazzling and foreign. Yi Kwangsu repeatedly says, "the only way for Koreans to survive would be to bring the Korean people to the same level of civilization as that of all the most civilized peoples in the world, that is, the same level of civilization as that of the Japanese people." (Mujong, 130) I am not strictly adhering to the idea that Korean modernization merely imitated Japanese and European modernization. I want to examine through Mujong how this foreign modernization process, expressed through the new woman and love construct, was internalized. I want to address questions such as what was the significance of love as an ideology during the colonial period? What did it help accomplish and where did it fail? Yi Kwangsu laid the foundation of love as a hegemonic ideological construct in which the new woman becomes the harbinger of society bringing with her the ideas of nuclear family, free marriage and divorce, romance and education. She is the ideal mother who possesses modern refinement and individuality, a symbol of Korea's modern consciousness and progress.

Threat of imperialism, which eventually became a reality with the colonization of Korea unleashed several other evils adding to the angst and hopelessness of Korea's already deteriorated state. In part two, I look at the "gendered construction" at this stage in Korean history through Hwanhui (Na Tohyang) and Kim Yonsil ch'eon (Kim Tongin). Each of these novels reveals a different "evil" of modernization under colonialism and provides insight into the limits and manifestation of the modern structures envisioned by the enlightenment thinkers of 1890s.

The gender reconstruction in Korean modernity sheds light on Korea's desire for its sovereignty and liberation. It was a social movement that revealed the psychological activities of society at the turn of the century and during its colonization. Set against the political and economical chaos, the reconstruction of gender relationships defined Korea's process through its modernization, but failed in the end to give sovereignty and liberation to its people.

title: Applications of Twist Bonding
abstract: Two processes have been developed by which twist boundaries may have useful application. The first of these, the compliant universal substrate, attempts to utilize a twist boundary to allow the growth of large lattice mismatch, low defect density heteroepitaxial layers. The second, the periodic template, attempts to use the periodic stress fields inherent in a twist boundary to produce two-dimensional surface topography with a very fine, and controllable, periodicity.
One sample of germanium grown on a silicon compliant substrate was analyzed in a JEOL 1200EX transmission electron microscope. The analysis showed that the twist boundary was not present in all regions of the Si-Ge interface. In those regions where the twist-bonded layer was observed, it was established that the Ge crystal was rotated approximately 45 degrees from the underlying bulk Si wafer. In those regions where the layer was not present, no such rotation was observed. Due to the small size of the domains in which the compliant layer was present or absent, strong conclusions with respect to its effect on defect densities can not be drawn. High magnification investigations of the twist bonded layer showed that it does exhibit a roughly periodic internal structure.
Attempts were made to fabricate periodic templates with silicon, gallium arsenide, and gold bicrystals. Twist bonding of gold proved to be the most successful of the three materials. Gold films were sputtered epitaxially onto sodium chloride crystals at 450 degrees C and subsequently annealed for one hour at 600 degrees C. Two films, one approximately 500 nm thick and one approximately 20 nm thick, were bonded together in a hot press at ~1.0 MPa at 300 degrees C for 1.2 hours. The misorientation angles of these bicrystals were kept below 5 degrees to maintain a reasonable dislocation spacing. The bicrystals were then characterized using the JEOL 1200EX TEM and a Nanoscope III atomic force microscope. Small amplitude surface modulations whose periodicity matched that of the underlying dislocation structure were observed.

title: Structural and dynamic investigations and temporal optimization of the optical and electrical properties of the microring modulator
abstract: Four different circumstances were investigated to discover what considerations must be assessed in order to generate the most rapid PIN optical modulator response. Beginning with the placement of the contacts in relation to each other, it was found that they logically influence the performance of the device with a direct linear relationship. Second, the lifetime dependency versus the concentration of the doped i region and select placement of electrical recombination centers were found to be inversely dependent, and ineffective over a larger range of concentrations, respectively. Tertiary discussions focus on the type of doping that exists in the i-region by considering analytic and simulated solutions, which demonstrated that the p-type region operates at more expedient rates due to the reversal of the limiting carrier selection by way of space-charge arguments. We present n-type to p-type ratios approaching 2 for index-switching concentrations. Finally, the fourth review deals with the amalgamation of what was learned from the previous inquiries to create, not an optimized PIN structure, but rather a design capable of lifetime ratios over 4, although the results are only preliminary. Inquiries into several other concepts are also conducted to find other points of interest.

title: Final Project Report to Atlantic Philanthropies: Creating an Open Access Paradigm for Scholarly Publishing
abstract: The Internet-First University Press (DVD and perfect bound copies also are available via e-mail: digital@cornell.edu).
A Zipped version of all of the files related to this report can be found at http://hdl.handle.net/1813/3459This is the final report for the Atlantic Philanthropies funded study, "Creating an Open Access Paradigm for Scholarly Publishing" (October 2002 thru June 2006). The DSpace digital repository, created at the MIT library, was implemented at Cornell University as one of the initial DSpace sites. We explored its usage as a repository and as a publishing distribution platform for low-cost (royalty-free) open access publishing that encompasses all disciplines and is openly accessible worldwide. We were especially interested in exploring how the Internet might be used to fundamentally improve communication among universities and with the rest of society. We commissioned some financial studies and held some workshops. We describe some models for lowering costs for university presses, libraries, and the universities that exploit attributes of online publishing that were not feasible with a paper-based model. In particular, we urge a fresh look at the system, not individual campus, level for potential savings.
We explored ways to encourage a shift in the faculty's willingness to effectively utilize this digital repository -- including a shift in emphasis from archiving to include online publishing. We published traditional materials, but also gave strong emphasis to multimedia materials as an alternative to print volumes that are expensive for publishing limited audience content. Video, until quite recently, has been very expensive, but that barrier can now be easily overcome. To encourage faculty participation we provided print-on-demand perfect binding and DVDs as a higher resolution (but more expensive and requiring a user fee) service. Eventually, we think, there will be a growing acceptance by faculty for online searching and browsing, with a need only for paying a user fee only for intensively used materials or otherwise for higher resolution presentations. abstract: Journey to Sibley is also available at http://ifup.cit.cornell.edu/lerner/This video features Cornell-educated architect and University Trustee Jill Lerner '75, B Arch '76, a Principal at the architectural firm, Kohn Pedersen Fox Architects (KPF.) Created in honor of her 30th Reunion in June 2005, the video is illustrated with vintage photos of Jill's days on the hill, her friends in college, and her dance performances. Jill is heard describing why she selected Cornell, telling about her years as an architecture student as well as an serious dance student and performer, and explaining her work at KPF. Her story is interspersed with brief commentary from Cornell classmates and friends, her family, and from founding KPF Principals, Gene Kohn and Bill Pedersen. Additionally, Jill describes why her Alma Mater has come to play such a significant role in her life in recent years and her election to the Cornell Board of Trustees for a four year term starting in July 2005.

title: Isolating Unique Bacteria from Terra Preta Systems: Using Culturing and Molecular Tools for Characterizing Microbial Life in Terra Preta
abstract: Poster presentation from the 2006 World Congress of Soil Science in Philadelphia, PAThe greater fertility of Terra Preta (TP) soils is thought to be due to their high black carbon (BC) content, which contributes to increased nutrient and moisture retention, and increased pH. It is likely that the unique chemistry of BC results in distinct microbial communities involved in nutrient cycling and organic matter turnover. TP soils offer an excellent model system for studying soils containing elevated and stable BC fractions in comparison to adjacent soils, because state factors, such as mineralogy, precipitation and climate, are the same between soils at a given site. Given this we compared the microbial communities in background soils adjacent to TP sites at four locations in the Brazilian Amazon. We used a combination of culture-based and molecular techniques to characterize and identify the key members of the bacterial communities in these

soils. We found that culturable bacteria were more numerous in TP soils than in adjacent background soils. Bacteria were grown on soil extract agar prepared from TP and adjacent soils and, by cross-cultivation, bacteria uniquely suited to growth on TP soil substrates were isolated. All isolates were screened by use of RFLP fingerprinting and then the 16S rDNA of unique isolates was sequenced. Clustering analysis of RFLP fingerprints indicated that isolates obtained from TP soils were more closely associated with each other than with bacterial isolates from adjacent soils within the same site. We hypothesized that TP would contain microbes that are uniquely associated with soils high in BC as compared to adjacent soils and that these organisms would have more phylogentic simlarity to each other across TP sites than in comparison to their corresponding adjacent soils. Of sequenced organisms most fell within the groupings Firmicutes, High G+C actinimyces, alpha-proteobacteria and gamma-proteobacteria, but only 18% had matches in the database above 97% and only 4% of sequences above 99% similarity. Finally we compared phylogenies of sequences obtained from individual soil isolates with those obtained from cloning and sequencing DNA from PCR-DGGE gels. Results from both approaches show a greater homology between sequences obtained from the four TP sites than between sequences obtained from adjacent and TP soils from the same site. By combining culture-based and culture-independent molecular techniques we obtained a more complete analysis of the suites of organisms unique suited to soils rich in BC.

Black carbon is widespread in the environment and, once created, persists over long time scales. Knowledge of the ecology of TP soils may contribute to a broader understanding of the behavior of BC in natural environments and its possible use in agricultural systems to improve soil fertility.

title: Thermal Radiation from Isolated Neutron Stars: Spectra and Polarizations
abstract: Recent observations of surface emission from isolated neutron stars (NSs) provide unique challenges to theoretical modeling of thermal radiative processes. We construct models of thermal emission from strongly magnetized NSs in which the outermost layer of the NS is in a condensed liquid or solid form, or is an ionized H or He atmosphere.

We calculate the emission properties (spectrum and polarization) of NSs with condensed Fe and H surfaces using a generalized form of Kirchhoff's Law, in the regimes where condensation may be possible. For smooth condensed surfaces, the overall emission is reduced from blackbody by less than a factor of two. The spectrum exhibits modest deviation from blackbody across a wide energy range, and shows mild absorption features associated with the electron plasma and ion cyclotron frequencies in the condensed matter. The roughness of the solid Fe condensate decreases the reflectivity of the surface, making the emission spectrum even closer to blackbody.

We provide an accurate treatment of vacuum polarization effects in magnetized NS atmosphere models. We treat the conversion of photon modes (due to ``vacuum resonance'' between plasma and vacuum polarizations), employing both the modal radiative transfer equations (coupled with an accurate mode conversion probability at the vacuum resonance) and the full radiative transfer equations for the photon Stokes parameters. We are able to quantitatively calculate the atmosphere structure, emission spectra, beam patterns, and polarizations for the range of magnetic field strengths $B=10^{12}-10^{15}$ G. In agreement with previous studies, we find that for NSs with magnetic field strengths $B/2 \ga B_l\simeq 7\times 10^{13}$ G, vacuum polarization reduces the widths of spectral features and softens the hard tail of magnetized atmosphere models. For $B\la B_l/2$, vacuum polarization does not change the emission spectra, but can affect the polarization signals.

We investigate the propagation of photon polarization in NS magnetospheres, and show that vacuum polarization induces a unique energy-dependent linear polarization signature, and can generate circular polarization in the magnetospheres of rapidly rotating NSs. We discuss the implications of our results for

observations of thermally emitting isolated NSs and magnetars, and the prospects for future spectral and polarization studies.

title: Understanding and managing the rhizosphere in agroecosystems
abstract: Agricultural systems represent the major form of land management, covering 5 billion hectares of the global terrestrial land area. The unintended consequences of agriculture extend well beyond agricultural landscapes and include environmental degradation and social displacement (Hambridge 1938; Vitousek et al. 1997; Friedland et al. 1991). Many have advocated the adoption of an ecosystem-based approach that would incorporate multifunctionality as an agricultural goal and entail broad application of fundamental ecological principles to food production (Dale et al. 2000; Drinkwater and Snapp 2005). This approach would aim to reduce external inputs and environmental degradation by increasing the capacity for internal, ecological processes to support crop production while contributing to other ecosystem services (Dale et al 2000).
Most efforts devoted to managing the rhizosphere in agricultural systems have emphasized processes that contribute directly to maximizing yield within the context of resource-intensive cropping systems. Several excellent reviews are available covering the role of rhizosphere biology in promoting crop growth under the nutrient rich conditions of high input agriculture (cf. Pinton et al. 2001; Lynch 1990). In particular, the biology of important root pathogens and plant-microbial N-fixing symbioses have been extensively studied within this context (Spaink et al. 1998; Whipps 2001). A smaller amount of rhizosphere research has focused on achieving modest improvements in yields under severe nutrient or water limitations that are commonly found in low-input, subsistence agroecosystems of the developing countries where farmers do not have access to purchased fertilizers and pesticides (Lynch 1990).
